(b) Attach the (AS02) tube to the (AS03) and (AS27) tubes, handtight only. See Figure 405 (Sheet 1).

(c) Install bolt to attach the (AS02) tube to the bracket handtight only. See Figure 405 (Sheet 2), View G.

(d) Install the clamp on the (LD02) tube and the clamp on the (LP48) tube and secure with nut and bolt, handtight only. See Figure 405 (Sheet 2), View L.

(e) Install the clamp on the (AS02) and (LD02) tubes and secure with a bolt, handtight only. See Figure 405 (Sheet 3), View H.

(f) Install clamp on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View I.

(g) Install clamps on the (AS02) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View J.

(h) Install clamp on (AS27) and (LD02) tubes and secure with nut and bolt, handtight only. See Figure 405 (Sheet 3), View K.

(i) Torque the (AS02) tube to the (AS03) tube and the (AS27) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(j) Torque the (LD02) tube to the internal tube and the (LD01) tube to 200 − 225 lb−in. (22.497 − 25.422 N.m).

(k) Torque all clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(14) (Pre SB PW4ENG 79−75) Install the (rear) No. 4 bearing scavenge tube assembly (LR06) as follows. See Figure 404.

(a) Remove the protective closures and attach the tube, elbow and nut threads lubricated with
R Antiseize Paste P06−054, wipe off unwanted
R paste, to the exhaust case internal tube nut at approximately the 10 o'clock position, and to the tube coupling forward of Flange M at approximately the 7 o'clock position, handtight only.

(b) Install the clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts to attach the tube to the Flanges N and P brackets. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the tube nut at the exhaust case connection to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(d) Torque the tube nut at the Flange N connection to 475 - 525 lb-in. (53.668 - 59.317 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(e) (Reference 2151) Install the spray shield to the inboard side of the Flange N connection and attach the forward end of the shield with a hose clamp. Torque the hose clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(f) Install a clamp to the rear end of the shield and the Flange M bracket with a bolt, threads lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(15) (Post SB PW4ENG 79-75 and Pre SB PW4ENG 79-76 only) Install (rear) No. 4 bearing scavenge tube assembly (LR06) as follows. See Figure 404.

(a) Install rear scavenge tube, elbow and nut threads
R lubricated with Antiseize Paste P06-054, wipe off
R unwanted paste, to the exhaust case internal tube
nut at approximately 10 o'clock position, and to the tube (LR05) coupling forward of Flange M at approximately 7 o'clock position, handtight only.

(b) Install loop clamp bracket on Flange M bracket at approximately 7 o'clock with bolts lubricated with Engine Oil P03-001, handtight only. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Secure tube to loop clamp bracket on Flange M bracket with one clamp and bolt, lubricated with Engine Oil P03-001, handtight only. Torque clamp bolt to 27 - 30 lb-in. (4.067 - 4.519 N.m).

(d) Install clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts securing tube to Flanges N and P brackets. Torque clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque tube nut at exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install theLockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) Torque tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Position tube shield to inboard side of Flange M connection and secure forward end of shield with hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(16) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing scavenge tube assemblies (LR21) and (LR22) which replace (LR06) as follows.

(a) Attach the (LR21) tube to the (LR05) tube handtight only. See Figure 405 (Sheet 4), View DE.

(b) Install clamps and secure with nuts and bolts, handtight only. See Figure 405 (Sheet 5), Views O and Q and (Sheet 6), Views F and R.

(c) Attach the (LR22) tube to the (LR21) tube and the port for the internal tube on the turbine exhaust case, handtight only. Lubricate the threads that are on the internal tube with Engine Oil P03−001. See Figure 405 (Sheet 7), Views E and AP.

(d) Install clamps on the (LR22) tube and secure with bolts, handtight only. See Figure 405 (Sheet 8), Views A, B, C and D.

(e) Torque the (LR21) tube to the (LR05) tube to 475 − 525 lb−in. (56.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

R
R

(f) Torque the (LR21) tube to the (LR22) tube to 475 − 525 lb−in. (56.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) Torque the internal tube nut to the (LR22) tube to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(17) (Post SB PW4ENG 79−76) Install the shields for the No. 4 bearing oil scavenge lines as follows.

(a) Install shield at the (LR05) tube to the (LR21) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 4), View DE.

(b) Install shield at the (LR21) tube to the (LR22) tube connection. Secure shield with clamp or bolt as applicable. See Figure 405 (Sheet 7), View E.

(c) Torque the clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(d) Torque the nut and bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(18) Install the No. 4 bearing oil pressure housing and strainer as follows.

(a) Remove the protective closures. Install a packing, lubricated with Engine Oil P03−001, to the groove in the strainer. Lubricate the threads with Engine Oil P03−001, and install the strainer to the strainer housing, handtight only.

(b) Install the strainer housing, threads lubricated with Engine Oil P03−001, to the exhaust case internal tube nut at approximately the 10:30 o'clock position, handtight only.

(19) (Pre SB PW4ENG 79−76) Install (rear) No. 4 bearing oil pressure tube assembly (LP16) as follows.

(a) Remove the protective closures. Install the tube, threads lubricated with Engine Oil P03−001, at both ends, to the last chance strainer housing on the exhaust case, and to the tube nut forward of Flange M at approximately the 10 o'clock position, handtight only.

(b) Install clamps, bolts, threads lubricated with Engine Oil P03−001, spacer, and nuts to attach the tube to the brackets at Flanges M, N, P and to the adjacent scavenge tube. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Torque the tube nuts at both ends of the tube to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nuts.

(d) Torque the exhaust case internal tube nut to the last chance strainer to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the tube nut.

(e) Torque the strainer element to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) (Reference 2151) Install the spray shield to the inboard side of the pressure tube connection forward of Flange M. Attach the forward end of the shield to the bracket on the diffuser case with a clamp and bolt, threads lubricated with Engine Oil P03−001. Torque the clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Attach the rear of the spray shield with a hose clamp. Torque the clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(20) (Post SB PW4ENG 79−76) Install (rear) No. 4 bearing oil pressure tube assemblies (LP47) and (LP48) which replace (LP16) as follows. Also install the No. 4 bearing strainer element as follows.

(a) Attach the coupling nut on the (LP15) tube to the (LP47) tube, handtight only. See Figure 405 (Sheet 9), View LA.

(b) Install clamps and secure with bolts. See Figure 405 (Sheet 9), Views U, T and S.

(c) Install packing, lubricated with Engine Oil P03−001 to the groove in the No. 4 bearing strainer element. See Figure 405 (Sheet 10), View G.

(d) Install the No. 4 bearing strainer element into the No. 4 bearing strainer element housing, handtight only. Lubricate threads with Engine Oil P03−001. See Figure 405 (Sheet 10), View G.

(e) Install the element housing, lubricated with Engine Oil P03−001, on to the tube nut at approximately the 7 o'clock position, handtight only. See Figure 405 (Sheet 10), View G.

(f) Attach the (LP48) tube to the strainer housing and the (LP47) tube, handtight only. See Figure 405 (Sheet 10), Views G and CA.

(g) Install clamps and secure with bolts and nuts as necessary. See Figure 405 (Sheet 11), Views M, N, B1 and P and (Sheet 12), Views R and F.

(h) Torque the strainer to the strainer housing to 150 − 170 lb−in. (16.948 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(i) Torque the internal tube nut to the strainer housing to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(j) Torque the (LP48) tube to the strainer housing to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(k) Torque the (LP48) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(l) Torque the (LP15) tube to the (LP47) tube to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(m) Torque all the installed clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(21) (Post SB PW4ENG 79−76) Install the shields for the No. 4 bearing oil pressure lines as follows.

(a) Install shield at the (LP47) tube to the (LP15) tube connection. Secure shield with clamps. See Figure 405 (Sheet 9), View LA.

(b) Install shield at the (LP47) tube to the (LP48) tube connection. Secure shield with clamps. See Figure 405 (Sheet 10), View CA.

(c) Install shield at the (LP48) tube to the strainer housing connection. Secure shield with clamps. See Figure 405 (Sheet 10), View G.

(d) Torque all clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-03

Task 72-00-54-450-001:

1. Install The (PT4.95) Average Pressure And Temperature Probes
   A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-023	Silver Goop (PWA 36001)

B. Procedure
See Figure 401.
(1) Remove the covers.
(2) Install each (PT4.95) average pressure and temperature probe to the exhaust case as follows.
  (a) Move the EEC PT4.95 manifold and TT4.95 cable away from the opening and install the probe.
  (b) Install the TT4.95 thermocouple into the probe and align the boltholes.
  (c) Align the TT4.95 cable with the boltholes and install the three bolts lubricated with Silver Goop (P06-023).
  (d) Torque the bolts to 54 - 60 lb-in. (6.101 - 6.779 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292) to the two bolts away from the tube adapter.

CAUTION: DO NOT LUBRICATE THE EEC SENSING TUBES OR ADAPTERS. CONTAMINATION OF THE EEC CAN RESULT.

  (e) Tighten and torque the EEC PT4.95 manifold (AS33) or (AS34) nut to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292) to the adjacent bolt.

Figure 401 (Sheet 2)
(Task 72−00−54−450−003)

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−03

CAUTION: USE THE TORQUE LIMITS FOR THE THERMOCOUPLE NUTS. TOO MUCH TORQUE CAN RESULT IN DAMAGE TO THE THERMOCOUPLE.

(f) Attach the cable ends to the thermocouple studs with the lockwashers and nuts. Torque the (larger) alumel nuts to 10 − 15 lb−in. (1.130 − 1.695 N.m). Torque the (smaller) chromel nuts to 8 − 12 lb−in. (0.904 − 1.356 N.m).

(g) Install the clamp bolts, lubricated with Engine Oil (P03−001), and nuts that attach the adjacent TT4.95 cable and PT4.95 manifold clamps. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test the engine per the Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-04

Task 72-00-54-450-002-A:

1. Install The EGT (TT4.95) Thermocouple Cable - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226-03		

B. Procedure - Right Side
See Figure 401 and Figure 402.

(1) Remove the nuts and lockwashers from the thermocouple terminal studs at the 1:00 and 4:30 o'clock positions. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(2) Remove the nuts from the junction box terminal studs. Connect the thermocouple cable leads and the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 - 22 lb-in. (2.034 - 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 - 18 lb-in. (1.695 - 2.034 N.m). See Figure 402.

(3) Install the clamp halves around the cables at the junction box. Attach the clamp halves to the ears on the junction box with screws, threads lubricated with Engine Oil P03-001. Torque the screws to 16 - 22 lb-in. (1.808 - 2.486 N.m).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−04

(4) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the front corner of the cover attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(5) Install the cable clamps to the brackets adjacent to the two thermocouples. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views A and C.

(6) Install the cable clamps to the brackets on Flange T at seven locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views B and D.

(7) Install the outer support bracket to the brackets on Flanges P and T. Attach the bracket with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(8) Install the front and rear inner brackets over the cables and to the outer support bracket. Attach the brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(9) Align the thermocouple cable leads attached to the studs on the thermocouple so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT contact the adjacent bolt heads or lockwire.

C. Procedure − Left Side
See Figure 401 and Figure 402.

(1) Remove the nuts and lockwashers from the thermocouple terminal studs at the 10 and 7 o'clock positions. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(2) Remove the nuts from the junction box terminal studs. Connect the thermocouple cable leads and the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 − 22 lb−in. (2.034 − 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 − 18 lb−in. (1.695 − 2.034 N.m). See Figure 402.

(3) Install the clamp halves around the cables at the junction box. Attach the clamp halves to the ears on the junction box with screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m).

(4) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the front corner of the cover. Attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(5) Attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 75 − 85 lb−in. (8.474 − 9.604 N.m). Install lockwire See View E.

(6) Install the cable clamps to the bracket adjacent to the thermocouple at the 7 o'clock position. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View I.

(7) Install the cable clamps and the EEC PT4.95 manifold clamps to the brackets on Flange T. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views G and H.

(8) Install the cable clamp to the bracket brazed on the EEC PT4.95 manifold. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(9) Install the outer support bracket to the brackets on Flanges P and T. Attach the bracket with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(10) Install the front and rear inner brackets over the cables and to the outer support bracket. Attach the brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(11) Align the thermocouple cable leads attached to the studs on the thermocouple so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller) studs to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT contact the adjacent bolt heads or lockwire.

D. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Adjustment/Test−00.

Task 72−00−54−450−002−B:

2. Install The EGT (TT4.95) Thermocouple Cable − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226−03		

B. Procedure − Right Side
See Figure 403 and Figure 404.

(1) Remove the nuts and lockwashers from the thermocouple terminal studs at the 1:00 and 4:30 o'clock positions. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(2) Remove the nuts from the junction box terminal studs. Connect the thermocouple cable leads and the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 − 22 lb−in. (2.034 − 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 − 18 lb−in. (1.695 − 2.034 N.m). See Figure 404.

EGT (TT4.95) Thermocouple Cable Junction Box (Pre SB PW4ENG 72−134)
Figure 402
(Task 72−00−54−450−002−A)

(3) Install the clamp halves around the cables at the junction box. Attach the clamp halves to the ears on the junction box with screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m).

(4) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the rear corner of the cover. Attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(5) Install the cable clamps to the brackets adjacent to the two thermocouples. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views A and C.

(6) Install the cable clamps to the brackets on Flange T at five locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View B.

(7) Install the cable clamp to the bracket brazed on the EEC PT4.95 manifold at the 4:30 o'clock position. Attach clamp with bolt, threads lubricated with Engine Oil P03−001 and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

(8) Make a loop in the thermocouple cable adjacent to the junction box. Attach the cable clamp, nearest to the loop, to the front support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(9) Install the front positioning plate on the two cables with the spacers, inboard, between the cables. Attach the plate to the front support bracket with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

NOTE: The cables installed below the positioning plate will be compressed by the plate when torquing the bolts.

(10) Install the positioning plate on the thermocouple cable at approximately the 5 o'clock position. Install the cable to the left of the inner spacer and to the right of the outer spacer on the plate. Attach the positioning plate and the clamp on the EEC PT4.95 manifold to the support bracket with two bolts, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

NOTE: The cable installed below the positioning plate will be compressed by the plate when torquing the bolts.

(11) Install the cable clamp to the inboard side of the reinforcing plate at the 5:30 o'clock position. Attach the clamp to the plate with a bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(12) Align the thermocouple cable leads attached to the studs on the thermocouples so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT CONTACT the adjacent bolt heads or lockwire.

(13) Clamp the bottom two thermocouple leads at the 4:30 o'clock thermocouple to the EEC PT4.95 manifold, 1/2 inch (12.700 mm) from the manifold nut. Attach the leads with two clamps, bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

C. Procedure − Left Side
See Figure 403 and Figure 404.

(1) Remove the nuts and lockwashers from the thermocouple terminal studs at the 10 and 7 o'clock positions. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(2) Remove the nuts from the junction box terminal studs. Connect the thermocouple cable leads and the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 − 22 lb−in. (2.034 − 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 − 18 lb−in. (1.695 − 2.034 N.m). See Figure 404.

(3) Install the clamp halves around the cables at the junction box. Attach the clamp halves to the ears on the junction box with screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m).

(4) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the rear corner of the cover. Attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(5) Attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position with a bolt, threads lubricated with Engine Oil Engine Oil P03−001. Torque the bolt to 75 − 85 lb−in. (8.474 − 9.604 N.m). Install lockwire. See View E.

(6) Clamp the top two thermocouple leads at the 10 o'clock thermocouple to the bracket brazed on the EEC PT4.95 tube. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View E.

(7) Install the cable clamps, and a clamp on the bottom two thermocouple leads, to the bracket adjacent to the thermocouple at the 7 o'clock position. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, nuts and spacer. Install the spacer between the lead clamp and the cable clamp. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View I.

(8) Install the cable clamps and the EEC PT4.95 tube/manifold clamps to the brackets on Flange T. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views G and H.

(9) Install the cable clamp to the bracket brazed on the EEC PT4.95 tube. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(10) Make a loop in the thermocouple cable adjacent to the 7 o'clock thermocouple. Attach the cable clamp, nearest to the loop, to the rear support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(11) Install the rear positioning plate with the rear spacer inside the cable/thermocouple lead loop and the front spacer inside the cable adjacent to the cable clamp. Attach the positioning plate to the rear support bracket with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(12) Install the front positioning plate on the two cables with the spacers, inboard, between the cables. Attach the plate to the front support bracket with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

NOTE: The cables installed below the positioning plate will be compressed by the plate when torquing the bolts.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(13) Align the thermocouple cable leads attached to the studs on the thermocouples so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT CONTACT the adjacent bolt heads or lockwire.

D. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Adjustment/Test−00.

Figure 404
(Task 72−00−54−450−002−B)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-54-450-003-A:

1. Install The EGT (TT4.95) Box And Cable Assembly - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226-03		

B. Procedure
See Figure 401 and Figure 402.

(1) Install the box and cable assembly to the bracket on Flange P. Lubricate the threads on the bracket studs with Engine Oil P03-001, and attach the junction box to the bracket with nuts. Torque the nuts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(2) Remove the nuts and lockwashers from the thermocouple terminal studs at the four thermocouple locations. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only. See Views A, C, E, and I.

(3) Remove the lockwire and four screws that attach the cover to the junction box. Remove the cover. See Figure 402.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(4) Remove the nuts from the junction box terminal studs. Connect the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 - 22 lb-in. (2.034 - 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(5) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the front corner of the cover. Attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(6) Attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 75 − 85 lb−in. (8.474 − 9.604 N.m). Install lockwire. See View E.

(7) Install the cable clamps to the brackets adjacent to the thermocouples. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views A, C, and I.

(8) Install the cable clamps and the EEC PT4.95 manifold (AS03)clamps to the brackets on Flange T. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views G and H.

(9) Install the cable clamp to the bracket brazed on the EEC PT4.95 manifold. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(10) Install the cable clamps to the brackets on Flange T at seven locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views B and D.

(11) Install the outer support bracket to the brackets on Flanges P and T at the 7 o'clock position. Attach the bracket with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(12) Install the front and rear inner brackets over the cables and to the outer support bracket. Attach the brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(13) Align the thermocouple cable leads attached to the studs on the thermocouple so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT CONTACT the adjacent bolt heads or lockwire.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Adjustment/Test−00.

Task 72−00−54−450−003−B:

2. Install The EGT (TT4.95) Box And Cable Assembly − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226−03

EGT (TT4.95) Thermocouple Cable Junction Box (Pre SB PW4ENG 72−134)
Figure 402
(Task 72−00−54−450−003−A)

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−05

(1) Install the box and cable assembly to the bracket on Flange P. Lubricate the threads on the bracket studs with Engine Oil P03−001, and attach the junction box to the bracket with nuts. Torque the nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(2) Remove the nuts and lockwashers from the thermocouple terminal studs at the four thermocouple locations. Install the thermocouple cable leads to the thermocouple studs. Install the lockwashers and nuts (stepped washer face next to the lockwasher) handtight only. See Views A, C, E, and I.

(3) Remove the lockwire and four screws that attach the cover to the junction box. Remove the cover. See Figure 404.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(4) Remove the nuts from the junction box terminal studs. Connect the W6 cable leads to the studs. Install the nuts. (Reference 2273) Torque the alumel (larger) nuts to 18 − 22 lb−in. (2.034 − 2.486 N.m). (Reference 2273) Torque the chromel (smaller) nuts to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(5) (Reference 2273) Install the cover on the junction box. Put the W6 cable ground lead terminal below the rear corner of the cover. Attach the cover and ground terminal with four screws, threads lubricated with Engine Oil P03−001. Torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Install lockwire.

(6) Attach the cable clamp and pressure probe to the exhaust case at the 10 o'clock position with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 75 − 85 lb−in. (8.474 − 9.604 N.m). Install lockwire. See View E.

(7) Clamp the top two thermocouple leads at the 10 o'clock thermocouple to the bracket brazed on the EEC PT4.95 tube (AS34). Attach the clamp with bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View E.

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−05

(8) Install the cable clamps to the brackets adjacent to the thermocouples. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views A and C.

(9) Install the cable clamps and the EEC PT4.95 tube/manifold clamps to the brackets on Flange T at five locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See Views G and H.

(10) Install the cable clamps to the brackets on Flange T at five locations. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View B.

(11) Install the cable clamp to the bracket brazed on the EEC PT4.95 manifold at the 4:30 o'clock position. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

(12) Clamp the bottom two thermocouple leads at the 4:30 o'clock thermocouple to the EEC PT4.95 manifold, 1/2 inch (12.700 mm) from the manifold nut. Attach the leads with two clamps, bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

(13) Install the cable clamp to the bracket brazed on the EEC PT4.95 tube. Attach the clamp with bolt, threads lubricated with Engine Oil P03−001 and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(14) Install the cable clamps, and a clamp on the bottom two thermocouple leads, to the bracket adjacent to the thermocouple at the 7 o'clock position. Attach the clamps with bolts, threads lubricated with Engine Oil P03−001, nuts and spacer. Install the spacer between the lead clamp and the cable clamp. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View I.

(15) Make a loop in the thermocouple cable adjacent to the 7 o'clock thermocouple. Attach the cable clamp, nearest to the loop, to the rear support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(16) Install the rear positioning plate with the rear spacer inside the cable/thermocouple lead loop and the front spacer inside the cable adjacent to the cable clamp. Attach the positioning plate to the rear support bracket with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(17) Make a loop in the thermocouple cable adjacent to the junction box. Attach the cable clamp, nearest to the loop, to the front support bracket with a bolt, threads lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

(18) Install the front positioning plate on the two cables with the spacers, inboard, between the cables. Attach the plate to the front support bracket with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View J.

NOTE: The cables installed below the positioning plate will be compressed by the plate when torquing the bolts.

(19) Install the positioning plate on the thermocouple cable at approximately the 5 o'clock position. Install the cable to the left of the inner spacer and to the right of the outer spacer on the plate. Attach the positioning plate and the clamp on the EEC PT4.95 manifold to the support bracket with two bolts, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

NOTE: The cable installed below the positioning plate will be compressed by the plate when torquing the bolts.

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−05

(20) Install the cable clamp to the inboard side of the reinforcing plate at the 5:30 o'clock position. Attach the clamp to the plate with a bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View D.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(21) Align the thermocouple cable leads attached to the studs on the thermocouples so they are parallel to one another. Torque the nuts at each thermocouple as follows:

(a) (Reference 2273) Torque the alumel connections (larger studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) (Reference 2273) Torque the chromel connections (smaller studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

NOTE: After the nuts are torqued, make sure that the cable leads DO NOT CONTACT the adjacent bolt heads or lockwire.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Adjustment/Test−00.

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-06

Task 72-00-54-450-004-A:

1. Install Exhaust Gas Temperature Thermocouples TT4.95 - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)

   A. Equipment And Materials Required

      Standard Tools:
      Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

      Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-023	Silver Goop (PWA 36001)

   B. Procedure
      See Figure 401.
      (1) Remove protective closures.
      (2) Install thermocouple at Location A (10 o'clock position) as follows.
         (a) Insert thermocouple into housing and case aligning boltholes. Secure in place with bolts, threads lubricated with Silver Goop (P06-023). Torque bolts to 54 - 60 lb-in. (6.101 - 6.779 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).

            CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT

         (b) Install PT4.95 manifold (AS03) nut to probe adapter. Torque the nut to 135 - 150 lb-in. (15.253 - 16.948 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).
         (c) Torque clamp bolts loosened as required to 36 - 40 lb-in. (4.067 - 4.519 N.m).
      (3) Install thermocouple at Location B (7 o'clock position) as follows.

Exhaust Gas Temperature Thermocouple
(Pre SB PW4ENG 72−134)
Figure 401
(Task 72−00−54−450−004−A)

(a) Insert thermocouple into housing and case aligning boltholes. Align bracket and secure with two bolts, threads lubricated with Silver Goop (P06−023). Torque bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

(b) Install bolt, threads lubricated with Engine Oil (P03−001), and nut securing PT4.95 manifold (AS03) clamp to bracket. Torque clamp bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(4) Install thermocouple at Locations C and D (4 and 1 o'clock position) as follows.

(a) Insert thermocouple(s) into housing and case aligning boltholes. Align bracket and secure with bolts, threads lubricated with Silver Goop (P06−023). Torque bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(5) Connect thermocouple cable leads to thermocouples. Secure with washers and nuts and torque as follows:

(a) Torque alumel connections (larger studs) to 10 − 15 lb−in. (1.130 − 1.695 N.m).

(b) Torque chromel connections (smaller studs) to 8 − 12 lb−in. (0.904 − 1.356 N.m).

C. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72−00−54−450−004−B:

2. Install Exhaust Gas Temperature Thermocouples TT4.95 − For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−06

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Material:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−289	Lockwire (AS3214−02)
P05−291	Cable, Safety (Optional)
P05−292	Ferrule, Safety Cable (Optional)
P06−023	Silver Goop (PWA 36001)

B. Procedure
See Figure 402.
(1) Remove the protection covers.
(2) Install thermocouple at Location A (10 o'clock position) as follows.
  (a) Install the thermocouple into the housing and case, and align the bolt holes. Install bolts, threads lubricated with Silver Goop (P06−023). Torque the bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

  CAUTION: DO NOT USED LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

  (b) Install the PT4.95 tube (AS34) nut to probe adapter. Torque the nut to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).
  (c) Torque the clamp bolts that were loosened to 36 − 40 lb−in. (4.067 − 4.519 N.m).
  (d) Install the thermocouple wires to the bracket (brazed) on the PT4.95 tube (AS34) with a clamp, bolt, threads lubricated with Engine Oil (P03−001) and a nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).
(3) Install the thermocouple at Location B (7 o'clock position) as follows.

Exhaust Gas Temperature Thermocouple
(Post SB PW4ENG 72−134)
Figure 402 (Sheet 2)
(Task 72−00−54−450−004−B)

(a) Install the thermocouple into the housing and case, and align the bolt holes. Align the bracket and install two bolts, threads lubricated with Silver Goop (P06−023). Torque the bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

(b) Attach the PT4.95 manifold (AS33) clamp to the bracket with a bolt, threads lubricated with Engine Oil (P03−001), and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install the thermocouple wires to the bracket with a clamp (next to bracket), spacer (between clamp and cable clamp), bolt, threads lubricated with Engine Oil (P03−001), and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(4) Install the thermocouple at Location C (4 o'clock position) as follows.

(a) Install the thermocouple into the housing and case, and align the bolt holes. Align the bracket and install bolts, threads lubricated with Silver Goop (P06−023). Torque the bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

CAUTION: DO NOT USE LUBRICANTS ON EEC SENSING TUBES, ADAPTERS, OR PACKINGS. CONTAMINATION OF EEC CAN RESULT.

(b) Install the PT4.95 manifold (AS33) nut to the probe adapter. Torque the nut to 135 − 150 lb−in. (15.253 − 16.948 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

(c) Install the thermocouple wires to the clamp on the PT4.95 manifold (AS33) with a clamp, bolt, threads lubricated with Engine Oil (P03−001) and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(5) Install the thermocouple at Location D (1 o'clock position) as follows.

(a) Install the thermocouple into the housing and case, and align the bolt holes. Align the bracket and attach with bolts, threads lubricated with Silver Goop (P06−023). Torque the bolts to 54 − 60 lb−in. (6.101 − 6.779 N.m). Install the Lockwire (P05−289) or Safety Cable (P05−291) and Safety Cable Ferrule (P05−292).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−06

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(6) Attach the thermocouple wire connectors to the thermocouple studs. Install the washers and nuts to the studs and torque the thermocouple nuts.
  (a) Torque the alumel connections (larger studs) to 10 − 15 lb−in. (1.130 − 1.695 N.m).
  (b) Torque the chromel connections (smaller studs) to 8 − 12 lb−in. (0.904 − 1.356 N.m).

C. Postrequisites
  (1) Use the Repair Test Reference Table and do a test of the engine. See 71−00−00, Adjustment/Test−00.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-07

Task 72-00-54-450-005:

1. Install EGT (TT4.95) Thermocouple Housing

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

ITEM NO.	DESIGNATION
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-023	Silver Goop (PWA 36001)

B. Procedure

See Figure 401.

(1) Remove protective closures.

(2) Install EGT (TT4.95) thermocouple housing to exhaust case bosses aligning boltholes. Install one bolt (in forward hole), threads lubricated with Silver Goop (P06-023), handtight only.

(3) Install EGT (TT4.95) thermocouple probe into housing aligning rearward boltholes). Position harness bracket over probe holes and install two bolts, threads lubricated with Silver Goop (P06-023), handtight only.

(4) Torque all bolts to 54 - 60 lb-in. (6.101 - 6.779 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).

(5) At Location B only, secure EEC PT4.95 manifold (AS33) clamp with bolt, threads lubricated with Engine Oil (P03-001), and nut. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(6) Connect thermocouple cable leads to thermocouple probe and secure with washers and nuts. Torque nuts as follows:
   (a) Torque alumel connections (larger studs) to 10 - 15 lb-in. (1.130 - 1.695 N.m).
   (b) Torque chromel connections (smaller studs) to 8 - 12 lb-in. (0.904 - 1.356 N.m).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−07

(7) At Location B install the thermocouple wires to the bracket with a clamp (next to bracket), spacer (between clamp and cable clamp), bolt, threads lubricated with Engine Oil (P03−001) and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m) (Post SB PW4ENG 72−134).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-54-420-002:

1. Install No. 4 Bearing And Seals

NOTE: See Figure 401 for part/assembly installation sequence.

A. Prerequisites

(1) See 72-00-54, Inspection/Check-01 Task 72-00-54-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

R	PWA 85453	Drift, Install (Optional to PWA 106326)
R	PWA 106326	Drift, Install (No. 4 Bearing Inner Race, Seals, And Spacers)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	4	72-54-00/4/60
Key Washer	4	72-54-00/4/70
Key Washer	3	72-54-00/5/20
Key Washer	2	72-54-00/5/60
Key Washer	2	72-54-00/5/70
Key Washer	8	72-54-00/4/110
Packing	1	72-54-00/4/90
Packing	1	72-54-00/5/1
Packing	1	72-54-00/5/90

C. Procedure

(1) Ensure that No. 4 bearing (carbon) face seal gap dimensional requirement (Reference 829) is met.

CAUTION: MAKE SURE THE NO. 4 BEARING FACE SEAL, FRONT SEAL SPACER AND REAR SEAL SPACER ARE INSTALLED CORRECTLY. INCORRECTLY ASSEMBLED PARTS CAN CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

(2) (Reference 1003) Install No. 4 bearing inner race, face seal (carbon) and seal spacers (front) and (rear). See Figure 402 and Figure 403.

NOTE: All parts must be within ±10°F (±5.6°C) when making all measurements.

(a) Stack 6th stage LPT airseal (402/2), No. 4 bearing seal spacers (front) (402/3) and rear (402/5) and No. 4 bearing inner race (402/6) on bench. Ensure that zero clearance is maintained between mating faces. Measure overall stacking dimension and record as Dimension N.

(b) Measure dimension from 6th stage airseal shoulder Face P, to rear face of front compressor drive turbine shaft (402/1). Record as Dimension R.

(c) Dimension N − Dimension R must equal 0.005 − 0.020 inch (0.13 − 0.51 mm).

(d) Position 6th stage LPT airseal (403/2) on front compressor drive turbine shaft (403/1). Seat airseal onto shoulder of rear hub using PWA 85453 or PWA 106326 Drift and mallet. R

(e) Install No. 4 bearing (front) seal spacer (403/3), large OD end forward, onto the front compressor drive turbine shaft (403/1). Seat the seal spacer to the last installed 6th stage LPT airseal (403/2) with the PWA 85453 or PWA 106326 Drift and a mallet. R R

CAUTION: HANDLE THE NO. 4 BEARING (CARBON) FACE SEAL WITH CARE AS THIS SEAL CAN EASILY BE DAMAGED.

(f) Carefully install the No. 4 bearing (carbon) face seal (403/4) onto the rear face of the last installed No. 4 bearing (front) air seal spacer. The gap of the No. 4 bearing (carbon) face seal must be at the 12:00 o'clock position.

(g) Install the No. 4 bearing (rear) seal spacer (403/5), smaller OD rearward, onto the turbine shaft. Engage the No. 4 bearing (rear) seal spacer to the last installed No. 4 bearing (front) seal spacer on the turbine shaft with the R PWA 85453 or PWA 106326 Drift and a mallet.

(h) Heat the No. 4 bearing inner race (403/6). See Standard Practices Manual, PN 585005.

(i) Install the heated No. 4 bearing inner race onto front compressor drive turbine shaft (403/1). R Using PWA 85453 or PWA 106326 Drift and mallet, seat inner race and previously installed spacers.

(j) Measure Dimension S from rear face of No. 4 bearing inner race to rear face of front compressor drive turbine shaft (402/1). See Figure 402.

(k) Dimension S must equal Dimension N - Dimension R plus 0.000 or minus 0.001 inch (plus 0.000 or minus 0.025 mm).

(l) If Dimension S is not within limits, remove bearing inner race, spacers and seals from turbine shaft and repeat steps (d) through (i).

(3) Lubricate new packing (405/2) with Engine Oil P03-001, and install packing into groove in front diameter of No. 4 bearing retaining plate (404/3). Align boltholes and install retaining plate into rear inner diameter of front compressor drive turbine shaft (404/6). Secure retaining plate using bolts (404/5) lubricated with Engine Oil P03-001, and key washers (404/4). Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Bend tabs of key washers. See Figure 404.

(4) Install No. 4 bearing outer race and rollers.

CAUTION: BEARING INNER RACE IS INSTALLED ON FRONT COMPRESSOR DRIVESHAFT. ENSURE THAT ALL BEARING DETAILS ARE KEPT TOGETHER. MIXING OF BEARING DETAILS MAY CAUSE DAMAGE TO BEARING.

(a) Remove No. 4 bearing outer race and rollers from container.

(b) Install two seal rings (405/1) into grooves in OD of bearing outer race. See Figure 405. Position the seal ring gaps within Area E, 180 degrees from the No. 4 bearing (oil) nozzle, as shown in Figure 406.

(c) Align four slots in rear face of bearing outer race with slots in exhaust case inner flange rear face and install bearing outer race with rollers into No. 4 bearing support flange in exhaust case.

(d) Secure outer race using four retaining plates (405/3) (chamfered side out), eight bolts (405/6) lubricated with Engine Oil P03−001 and key washers (405/4) and (405/5). Use key washer PN MS9582−10 at round bolthole locations. Use key washer PN MS9581−10 at elongated bolthole locations.

(e) (Reference 90) Make sure that the clearance between the retaining plate and the grooves in the bearing outer race is in the limit specified in Index 2.

(f) With retaining plate gaps within limits given in previous step, torque bolt to 75 −85 lb−in. (8.474 − 9.604 N.m). Recheck gap per previous step.

(g) Bend tabs of washers to secure bolts.

(5) Remove brass shims supporting low pressure turbine rotor. Shims are between 6th stage blade outer shrouds and 6th stage air sealing ring segments.

(6) Install No. 4 bearing oil scavenge tube (407/4). See Figure 407.

(a) Install new packing (407/1) in groove in recess in exhaust case rear inner diameter.

(b) Align boltholes in flange of No. 4 bearing oil scavenge tube (407/4) with boltholes in recessed pad in exhaust case rear inner diameter. Align bolthole in detail tube bracket with bolthole in exhaust case rear inner diameter. Secure tube using three bolts (407/3) and key washers (407/2). Torque bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Bend tabs of key washers.

(7) Install No. 4 bearing oil nozzle and No. 4 bearing packing transfer tube. See Figure 408.

(a) Position No. 4 bearing nozzle into port in pad on exhaust case rear inner diameter. Secure nozzle using two bolts (408/1), lubricated with Engine Oil P03−001, and two washers (408/2) and (408/3).

(b) Install No. 4 bearing packing transfer tube (408/5) through port in nozzle (408/3) and into port in exhaust case rear flange. Secure transfer tube using two bolts (408/7) lubricated with Engine Oil P03−001, and washers (408/6) and (408/8). Torque bolts (408/1) securing nozzle to exhaust case and bolts (408/7) securing transfer tube to nozzle to 75 − 85 lb−in. (8.474 − 9.604 N.m). Bend tabs of washers (408/2), (408/4), (408/6) and (408/8).

CAUTION: YOU MUST APPLY ENGINE OIL FULLY TO THE COVER PACKING OR YOU WILL CUT THE PACKING DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

CAUTION: INSTALL THE COVER INTO POSITION USING FOUR WORK BOLTS EQUALLY SPACED AROUND THE COVER. TIGHTEN THE BOLTS EQUALLY IN SMALL INCREMENTS TO PULL THE COVER INTO POSITION EQUALLY. MONITOR THE ENGAGEMENT OF THE COVER TO MAKE SURE THAT THE PACKING IS NOT CUT DURING INSTALLATION. A CUT PACKING WILL CAUSE SUBSEQUENT OIL LOSS AND CAN CAUSE AN IN−FLIGHT SHUTDOWN.

(8) Install the No. 4 bearing cover as follows: See Figure 409.

(a) Apply Engine Oil P03−001 fully to the new packing (409/2).

(b) Install the new packing into the groove at the rear flange of the No. 4 bearing cover (409/3).

(c) Install the cover into the rear inner flange of the exhaust case (409/1).

(d) Install 4 work bolts equally spaced around the cover.

(e) Tighten the bolts equally in small increments to pull the cover into position equally.

(f) Monitor the engagement of the cover to make sure the packing is not cut.

(g) Remove the work bolts.

(9) Position No. 4 bearing heat shield (409/4) into recess in No. 4 bearing shield (409/5). Align bolt holes and install shield over previously installed No. 4 bearing cover (409/3) at rear inner flange of exhaust case. Secure the shield with bolts, lubricated with Engine Oil P03−001. Use 30 bolts (409/6) for covers with 30 boltholes (Pre SB PW4ENG 72−456), or 16 bolts for covers with 16 boltholes (Post SB PW4ENG 72−456). Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

D. Postrequisites

(1) Test engine per Repair Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-09

Task 72-00-54-450-006-A:

1. Install EEC Thermocouple And Airframe Cable (W6) - For Engines Without The Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)

NOTE: This procedure provides for installation of cable tube (support) and EEC thermocouple and airframe cable (W6).

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench Or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226-03		

B. Procedure
See Figure 401 and Figure 402.

(1) Install cable tube (support).

(a) Position tube to engine with brazed clamp at shorter straight end of tube against upper face of bracket at No. 7 fuel nozzle. Position other end of tube to outer face of bracket located on Flange P, at 5 o'clock position. See Views A and I.

(b) Secure brazed clamp on tube to bracket at No. 7 fuel nozzle, temporarily, with bolt, threads lubricated with Engine Oil P03-001, (bolthead up next to clamp on tube) and nut fingertight. See View I.

NOTE: Bolt securing brazed clamp to bracket at No. 7 fuel nozzle will be torqued in a later step.

(c) Secure brazed clamp on other end of tube to lower hole on outer face of bracket on Flange P with spacer between tube clamp and bracket. Install bolt, threads lubricated with Engine Oil P03−001, (head outboard next to clamp on tube) and nut. Tighten and torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View A.

(d) Secure clamp brazed on tube to bracket on rear flange of lower right turbine vane cooling air tube, at 3:30 o'clock position, with bolt, threads lubricated with Engine Oil P03−001, (head outboard next to clamp on tube) and nut. Tighten and torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View F.

(e) Secure clamp brazed on tube to bracket on LPT cooling air manifold support, at 5 o'clock position, with bolt, threads lubricated with Engine Oil P03−001, (head forward next to clamp), spacer, and nut. Tighten and torque bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). See View C.

CAUTION: SEE 72−00−00, INSTALLATION−00 FOR GENERAL INSTALLATION REQUIREMENTS FOR ELECTRICAL CABLES, LEADS AND CABLES.

CAUTION: AVOID TWISTING OR SEVERE BENDING OF WIRING HARNESSES AT ANY TIME DURING INSTALLATION OR DAMAGE TO CABLES MAY RESULT.

(2) Install EEC thermocouple and airframe cable (W6).

(a) Connect the W6P12 harness connector to the W5J12 harness receptacle attached to a large fuel manifold support bracket on Flange K at the 3:00 o'clock position as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:

- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(b) Route cable upward and rearward over bracket secured at turbine blade cooling air tube flange on valve located at 3 o'clock position. Route cable inboard of lower right turbine cooling air tube.

(c) Secure second clamp on cable to lower face of bracket securing cable tube to bracket at No. 7 fuel nozzle. Remove nut from bolt and position cable clamp over bolt. Reinstall nut fingertight. See View I.

(d) Secure first clamp on cable to outer face of bracket at turbine blade cooling air tube flange with bolt, threads lubricated with Engine Oil P03−001, (bolthead outboard next to clamp) and nut fingertight. See View J.

(e) Secure third clamp on cable to brazed clamp on tube with bolt, threads lubricated with Engine Oil P03−001, (bolthead outboard next to tube clamp) and nut fingertight. See View G.

(f) Secure fourth clamp on cable to lower face of bracket on diffuser case. Position TT3 thermocouple ground lead on top of brazed tube clamp. Install bolt, threads lubricated with Engine Oil P03−001, (bolthead next to ground lead) and nut fingertight. See View H.

(g) Remove nuts from TT3 thermocouple terminal studs. Connect thermocouple leads to terminal studs and secure with nuts (round collar end inboard). Align leads so they are parallel to one another.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(h) Torque nuts as follows:

1 (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

2 (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) Secure fifth, sixth, and eighth clamps on cable to brazed clamps on tube with bolts, threads lubricated with Engine Oil P03−001, (boltheads next to cable clamps) and nuts fingertight. See View B.

(j) Secure seventh cable clamp to brazed tube clamp with bolt, threads lubricated with Engine Oil P03−001, (bolthead inboard next to tube clamp) and nut fingertight. See View E.

(k) Secure ninth cable clamp and brazed tube clamp to outer face of bracket on HPT turbine case cooling air manifold support with bolt, threads lubricated with Engine Oil P03−001, (bolthead outboard next to tube clamp) and nut fingertight. See View D.

(l) Secure tenth, eleventh, twelfth, and thirteenth cable clamps to brazed tube clamps with bolts, threads lubricated with Engine Oil P03−001, (bolthead outboard next to cable clamp) and nuts fingertight. See View B.

(m) Secure fourteenth clamp to inboard side of brazed tube clamp with spacer between cable clamp and tube clamp. Install bolt, threads lubricated with Engine Oil P03−001, (bolthead outboard next to tube clamp) and nut fingertight. See View A.

(n) Secure last cable clamp to inner face of bracket on Flange P, at 5 o'clock position, with spacer between cable clamp and bracket. Install bolt, threads lubricated with Engine Oil P03−001, (bolthead inboard next to cable clamp) and nut fingertight. See View A.

(o) Tighten and torque all previously installed bolts and/or nuts securing cable clamps to brackets, or brazed tube clamps to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: DO NOT ATTACH THE GROUND WIRE TO THE TERMINAL STUDS.

(p) Remove nuts from EGT (TT4.95) box and cable assembly junction box located at 5:30 o'clock position on exhaust case. Connect cable leads to terminal studs and secure with nuts. Align leads so they are parallel to one another.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(q) Torque nuts as follows:

1 (Reference 2273) Torque alumel nuts (larger terminal stud) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

2 (Reference 2273) Torque chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(r) (Reference 2273) Install cover on junction box. Install ground lead terminal under front corner of cover. Secure cover and ground terminal with four screws. Tighten and torque screws to 16 − 22 lb−in. (1.808 − 2.486 N.m) and lockwire.

NOTE: Lockwire cover screw to clamp screw at cable end of junction box. Do not lockwire screws across cable.

Task 72−00−54−450−006−B:

2. Install EEC Thermocouple And Airframe Cable (W6) − For Engines With Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Post SB PW4ENG 72−134)

EGT (TT4.95) Thermocouple Junction Box And Cable
Figure 402
(Task 72-00-54-450-006-A)

(a) Place the tube to the engine with the longer straight end of the tube to the bottom side of the bracket on Flange P at approximately the 5:30 o'clock position. Place the other end of the tube under the bracket attached to the turbine blade cooling air tube (forward end). See Figure 404, Views B and Q for pre SB PW4ENG 73−163 configuration. See Figure 404, View B and Section Z−Z for post SB PW4ENG 73−163 configuration.

(b) Attach the tube to a bracket on the lower right turbine cooling air tube on the high turbine with a clamp, bolt, and nut. Lubricate the threads of the bolt with Engine Oil P03−001. Tighten the nut by hand. See View J.

(c) Attach the tube to a bracket on the high turbine cooling air manifold support at approximately the 4:30 o'clock position with a clamp, bolt, and nut. Lubricate the threads of the bolt with Engine Oil P03−001. Tighten the nut by hand. See View H.

(d) Attach the tube to a bracket on the low turbine cooling air manifold support at approximately the 5 o'clock position with a clamp, bolt, and nut. Lubricate the threads of the bolt with Engine Oil P03−001. Tighten the nut by hand. See View D.

NOTE: Bolts that attach the cable tube (support) to the brackets will be torqued in a later step.

CAUTION: SEE 72−00−00, INSTALLATION−00 FOR GENERAL INSTALLATION THAT IS NECESSARY FOR ELECTRICAL CABLES AND CABLE WIRES.

CAUTION: DO NOT TWIST OR BEND THE CABLE BADLY DURING INSTALLATION, OR DAMAGE TO THE CABLE CAN OCCUR.

(2) Install the EEC thermocouple and airframe cable (W6).

CAUTION: EXAMINE THE CABLE CONNECTORS AND THE MATING RECEPTACLES FOR BENT PINS AND CONTAMINATION. CAREFULLY MAKE STRAIGHT ANY BENT PIN AND CLEAN AS REQUIRED.

(a) (Pre SB PW4ENG 73−163) Connect the W6P12 cable connector to the W5J12 cable receptacle attached to a large fuel manifold support bracket on Flange K at the 3:30 o'clock position.

(b) (Post SB PW4ENG 73−163) Connect the W6P12 cable connector to the W5J12 cable receptacle attached to the TCA tube flange bracket on the turbine blade cooling air tube (lower right) (AP37) flange at the 3 o'clock position.

(c) Make the harness connector/harness receptacle connector as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is handtight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the

connector coupling nut. Use sufficient force to be sure:

- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal). This procedure will make sure the contacts are sufficiently engaged and the connector is tight.
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(d) (Post SB PW4ENG−73−192) Install cooling shields around W6 harness connector as follows. See Figure 404 (Sheet 14):

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

1 Position the cooling shields around the W6 harness connector W6P12 and slide the cooling shield tabs into TCA tube flange bracket. Make sure the shield with the hose fitting is on the bottom.

2 Install the clamps around the cooling shields. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

3 Install the cooling hose and clamp onto the bottom cooling shield fitting. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

(e) Place (route) the cable up and rearward above a bracket attached to the forward end of the turbine blade cooling air tube flange on a valve at the 3 o'clock position. Place the cable inboard of the forward end of the lower right turbine cooling air tube.

(f) Place the first cable clamp to the outboard side of the bracket on the turbine blade cooling air tube flange. Place the cable tube (support) with a clamp to the inboard side of the bracket. Attach the clamps to the bracket with a bolt, threads lubricated with Engine Oil P03−001 and a nut tightened by hand. See View Q (pre SB PW4ENG 73−163) or Section Z−Z (post SB PW4ENG 73−163).

(g) Place the second cable clamp to the top of the first attached (brazed) tube clamp. Attach the cable clamp to the tube clamp with a bolt, threads lubricated with Engine Oil P03−001 and a nut tightened by hand. See View P (pre SB PW4ENG 73−163) or View V (post SB PW4ENG 73−163).

(h) Place the cable tube (support) with a clamp to the outboard side of the bracket at the No. 7 fuel nozzle. Place the third cable clamp to the clamp on the tube. Attach the clamps to the bracket with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View O (pre SB PW4ENG 73−163) or View U (post SB PW4ENG 73−163).

(i) Place the fourth cable clamp to the top side of the second attached (brazed) tube clamp. Place the ground wire (lead) of the cable to the top of the fourth cable clamp. Place the fifth cable clamp to the bottom side of the tube clamp. Attach the ground wire and cable clamps to the tube clamp with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View M (pre SB PW4ENG 73−163) or View T (post SB PW4ENG 73−163).

NOTE: The fourth cable clamp is attached to the cable (lead) which has attached the TT3 thermocouple wire (leads).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(j) Remove the nuts from the TT3 thermocouple terminal studs. Connect the thermocouple wires (leads) to the terminal studs and install the nuts (round end of the nut inboard). Align the wires (leads) so they are parallel to each other. Torque the nuts as follows:

1 (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 – 22 lb–in. (2.034 – 2.486 N.m).

2 (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 – 18 lb–in. (1.695 – 2.034 N.m).

(k) Place the cable tube (support) with a clamp to the top side of the bracket on the diffuser case at the 3 o'clock position. Place the sixth cable clamp to the bottom side of the bracket. Attach the clamps to the bracket with a bolt, threads lubricated with Engine Oil P03–001 and a nut tightened by hand. See View N (pre SB PW4ENG 73–163) or View S (post SB PW4ENG 73–163).

(l) Place the seventh cable clamp to the forward side of the third attached (brazed) tube clamp. Attach the clamps together with a bolt, threads lubricated with Engine Oil P03–001 and a nut tightened by hand. See View L (pre SB PW4ENG 73–163) or View R (post SB PW4ENG 73–163).

(m) Place the eighth cable clamp to the bottom side of the fourth attached (brazed) tube clamp. Attach the clamps together with a bolt, threads lubricated with Engine Oil P03–001 and a nut tightened by hand. See View K.

(n) Place the ninth cable clamp to the bottom side of the fifth attached (brazed) tube clamp. Attach the clamps together with a bolt, threads lubricated with Engine Oil P03–001 and a nut tightened by hand. See View I.

(o) Place (route) the cable down along the cable tube (support). Place the following cable clamps to the outboard side of the following attached (brazed) tube clamps:

1 Place the tenth cable clamp to the sixth clamp of the tube.

2 Place the eleventh cable clamp to the seventh clamp of the tube.

3 Place the twelfth cable clamp to the eighth clamp of the tube.

4 Attach the cable clamps to the tube clamps with bolts, lubricated with Engine Oil P03−001 and nuts tightened by hand. See View G.

(p) Place the thirteenth cable clamp to the rear side of the ninth attached (brazed) tube clamp. Attach clamps together with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View F.

(q) Place the fourteenth cable clamp to the bottom side of the tenth attached (brazed) tube clamp. Attach clamps together with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View E.

(r) Place (route) the cable rearward along the cable tube (support). Place the following cable clamps to the bottom side of the following attached (brazed) clamps of the cable tube (support):

1 Place the fifteenth cable clamp to the eleventh clamp of the tube.

2 Place the sixteenth cable clamp to the twelfth clamp of the tube.

3 Attach the cable clamps to the tube clamps with bolts, lubricated with Engine Oil P03−001 and nuts tightened by hand. See View C.

(s) Place the slotted hole in the bracket (ear) on the tube part of the cable to the bottom side of the thirteenth attached (brazed) tube clamp. Attach clamps together with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View B.

(t) Place the end of the cable tube (support) with a clamp to the bottom side of the bracket on Flange P at approximately the 5:30 o'clock position. Place the remaining slotted hole in the bracket (ear) of the tube part at the end of the cable to the bottom side of the tube clamp. Attach clamps to bracket with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View B.

(u) Place the seventeenth (last) cable clamp to the top side of the bracket on Flange P at approximately the 6 o'clock position. Attach the clamp to the bracket with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View A.

(v) Install a clamp on the cable and place the clamp with the cable to the top side of the same bracket on Flange P. Attach the clamp to the bracket with a bolt, lubricated with Engine Oil P03−001 and a nut tightened by hand. See View A.

(w) Tighten and torque all of the last installed bolts and/or nuts attached to the cable and the cable tube (support) to brackets, or attached (brazed) tube clamps to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(x) Remove the nuts from the terminal studs of the EGT (TT4.95) junction box at the 5:30 o'clock position. Connect the cable wires (leads) to the terminal studs and attach with the nuts. Align the wires (leads) so they ae parallel to each other. See Figure 405.

NOTE: Do not attach the ground wire to the terminal studs. Torque the nuts as follows:

1 (Reference 2273) Torque the alumel nuts (large terminal stud) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

2 (Reference 2273) Torque the chromel nuts (small terminal stud) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(y) (Reference 2273) Install the cover on the junction box and attach with three screws. Place the ground wire (lead) to the rear right side of the cover (viewed from the rear) and attach with a screw. Tighten and torque the screws to 16 − 22 lb−in. (1.808 − 2.486 N.m). Lockwire the screws.

NOTE: Lockwire the cover screws to the clamp screw at the cable end of the junction box. Do not lockwire the screws across the cable.

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-10

Task 72-00-54-450-007:

1. Install EGT (TT4.95) Thermocouple Junction Box

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lockwire, MS9226-03		

B. Procedure
See Figure 401.

(1) Install junction box on Flange P bracket. Lubricate threads of bracket studs with Engine Oil P03-001, and secure junction box to bracket with nuts. Torque nuts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

CAUTION: DO NOT ATTACH THE GROUND WIRE TO THE TERMINAL STUD.

(2) Remove nuts from junction box studs. Connect and secure thermocouple cables and W6 cable leads to studs with nuts. Align leads so they are parallel to one another.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(3) Torque junction box stud nuts as follows:

(a) (Reference 2273) Torque alumel connections (larger stud) to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(b) (Reference 2273) Torque chromel connections (smaller stud) to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(4) Place clamp halves around cables and secure with two screws, threads lubricated with Engine Oil P03-001. Torque screws to 16 - 22 lb-in. (1.808 - 2.486 N.m).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSTALLATION−10

(5) (Reference 2273) For engines without the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Pre SB PW4ENG 72−134), install cover on junction box. Install ground lead terminal under front corner of cover. Secure cover and ground terminal with four screws. Torque screws to 16 − 22 lb−in. (1.808 − 2.486 N.m) and lockwire. See Figure 401 (Sheet 1).

NOTE: Do not lockwire clamp half screws together. Lockwire clamp half screws to cover screws.

(6) (Reference 2273) For engines with the revised TT4.95 cable and PT4.95 sensing manifold for increased engine core clearance (Post SB PW4ENG 72−134), install cover on junction box. Install ground lead terminal under rear corner of cover. Secure cover and ground terminal with four screws. Torque screws to 16 − 22 lb−in. (1.808 − 2.486 N.m) and lockwire. See Figure 401 (Sheet 2).

ENGINE GENERAL - TURBINE EXHAUST CASE - INSTALLATION-20

Task 72-00-54-420-005:

1. Install The Flange P Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)

B. Procedure

(1) Install the Flange P hardware as follows. See Figure 401 and Figure 402.

NOTE: There are 132 boltholes in Flange P. Top dead center is between the first and last boltholes (between bolthole 132 and bolthole 1). Bolthole numbers go clockwise (viewed from the rear).

(a) Apply Engine Oil P03-001 to the bolts.

(b) Install the bolts and brackets to Flange P and attach with nuts handtight only.

NOTE: Remove the work bolts and replace them with the engine bolts one at a time to keep the case seated.

NOTE: Numbers in parenthesis in the figure are the bolthole locations of the brackets.

(c) (Reference 978) Torque the Flange P bolts as follows.

1 Nuts must be tightened simultaneously in sets of two groups. Sets consist of groups number (1,2), (3,4), (5,6), (7,8), (9,10),(11,12) (13,14) and (15,16). See tourque sequence specified in reference figure.

NOTE: Fourteen of the 16 groups consist of eight bolts each. The remaining two groups consist of ten bolts each. See reference figure.

2 Tighten all sets of bolt groups described in previous step to initial torque of 75 − 100 lbf−in (8.474 − 11.298 N.m).

3 Tighten all set of bolt groups described in previous step to final torque of 180 − 200 lbf−in (20.337 − 22.597 N.m).

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

THE VIEW OF THE CONNECTOR IS MADE LARGER FOR IDENTIFICATION OF THE CONTACT LOCATIONS

FRONT FACE OF SOCKET INSERT IS SHOWN, REAR FACE OF SOCKET INSERT IS OPPOSITE

ENGINE GENERAL - TURBINE EXHAUST CASE - CLEANING-01

Task 72-00-54-160-001:

1. Clean EGT (TT4.95) Thermocouple

A. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Stiff Bristle Brush Nonmetallic (Tampico)	Stanley Home Products 116 Pleasant St. Easthampton, MA 01027

Consumable Materials:

Item No.	Designation
P05-005	Cloth, Cotton Lint Free

B. Procedure

See Figure 601.

(1) Perform cleaning operations as necessary exercising caution to prevent mechanical damage.

WARNING: CLEANING SOLVENT IS FLAMMABLE. USE IN WELL VENTILATED AREA. AVOID CONTACT WITH SKIN.

CAUTION: INSULATION MATERIAL USED WITHIN THERMOCOUPLE PROBE WILL READILY ABSORB LIQUIDS. SINCE OPERATION OF THERMOCOUPLE MAY BE ADVERSELY AFFECTED BY PRESENCE OF LIQUIDS IN INSULATION, IT IS IMPORTANT THAT LIQUID SOLVENTS ARE NOT USED IN ANY WAY THAT WOULD PERMIT SOLVENT ENTRY INTO PROBE PAST TERMINAL STUDS.

(2) Clean thermocouple head.

(a) Remove foreign deposits from head using brush and clean Lint Free Cotton Cloth (P05-005) and the SPOP 208 Wipe Method (Task 70-21-00-110-040).

(b) Dry with clean dry compressed air.

NOTE: Compressed air shall be maintained at 30 psig (206.8 kPa) maximum discharge pressure.

(3) Clean thermocouple sheath.

(a) Remove loose carbon deposits from thermocouple sheath by directing air at approximately 100 psig (689.5 kPa) through an air nozzle.

(b) To remove hardened carbon deposits from thermocouple sheath, use stiff bristle brush (nonmetallic) and the SPOP 208 Wipe Method (Task 70−21−00−110−040).
(c) Clean sheath by wiping surfaces with clean Lint Free Cotton Cloth (P05−005) and the SPOP 208 Wipe Method (Task 70−21−00−110−040).
(d) Dry with clean dry compressed air.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - CLEANING-02

Task 72-00-54-160-002:

1. Clean EGT (TT4.95) Box And Cable
   - A. Equipment And Materials Required - None
   - B. Procedure
     - (1) Clean external surfaces by wiping with cloth slightly dampened by SPOP 208 Wipe Method (Task 70-21-00-110-040).

       CAUTION: DO NOT LEAVE FOREIGN MATERIAL ON TERMINALS.

     - (2) If necessary, clean thermocouple harness and lead alumel and chromel terminal lugs using stainless steel brush or stainless steel pad (without soap).

       CAUTION: IMBEDDED STAINLESS STEEL PARTICLES MAY ADVERSELY AFFECT ACCURACY OF LOW LEVEL MILLI-VOLT EGT SIGNALS, THEREFORE, ENSURE THAT ALL FOREIGN MATERIAL IS REMOVED FROM TERMINALS.

     - (3) Remove residue using clean compressed air at 30 psig (206.8 kPa) maximum discharge pressure.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - CLEANING-03

Task 72-00-54-110-001:

1. Clean Coke From The Turbine Exhaust Case, Pressure And Scavenge Tubes

A. Prerequisites

(1) Remove the No. 4 bearing and seals per 72-00-54, Removal-08 (Task 72-00-54-020-002).

B. Equipment And Materials Required

Standard Tools:

Name	Manufacturer
Hand Suction Gun #6Y831	Grainger - Office K4138 33 Knightsbridge Parkway Lincolnshire, Il. 60069-3639
Air Powered Degreasing/ Cleaning Spray Gun #4Z668	
Rubber Plugs	Local Purchase

Consumable Materials:

Item No.	Designation
P05-005	Cloth, Cotton Lint Free
P05-294	Tape, Solvent Resistant

C. Procedure

(1) Remove the No. 4 bearing (oil) pressure tube (601/7). See Figure 601.

(a) Remove the lockwire (601/12) that secure the heat shields to the tube.

(b) Separate and remove the heat shields (601/8) and (601/11) from the tube.

(c) Remove the lockwire and the bolts (601/6) that secure the No. 4 bearing tube guide (601/5) to the turbine exhaust case.

(d) Disconnect the nut that secures the tube (601/7) to the adapter (601/10) in the inner rear flange of the turbine exhaust case.

(e) Remove the thrust wire (601/2) that secures the nut (601/1) to the tube (601/7). Remove the nut.

(f) Remove the lockwire and the bolts (601/3) that secure the No. 4 bearing pressure tube shield (601/4) to the turbine exhaust case at the 10:30 o'clock position as viewed from the rear.

(g) Move the tube (601/7) radially inward and remove the tube from the turbine exhaust case.

(h) Remove the adapter (601/10) and the packing (601/9). Discard the packing.

(2) Remove the No. 4 bearing scavenge (inner) tube (602/4).

See Figure 602.

(a) Remove the key washer (602/2) and the bolt (602/3) that secures the scavenge tube bracket to the turbine exhaust case inner flange at the 6 o'clock position.

(b) Remove the key washers (602/2) and the bolts (602/3) that secure the scavenge tube to the turbine exhaust case inner flange at the 7:30 o'clock position. Remove the scavenge tube. Discard the packing (602/1).

(3) Seal the No. 4 bearing compartment. See Figure 603.

(a) Seal the No. 4 bearing compartment gap with Solvent Resistant Tape (P05−294) or a rubber preformed packing.

NOTE: This will prevent the alkaline gel cleaning solution from spraying back onto the operator.

(b) Seal the No. 4 bearing inner seal area with a Cotton Lint Free Cloth (P05−005). Make sure the cloth is between the outer diameter of the LPT shaft and the inner diameter of the seal land.

(c) Seal the inner diameter of the LPT shaft with an elastic cover. Place the cover over the outer diameter of the LPT shaft,

(d) Use a plastic sheet to cover over the entire rear side of the turbine exhaust case.

NOTE: This will prevent any spray back of the alkaline gel cleaning solution from the turbine exhaust case.

(4) Clean the No. 4 bearing compartment. See Figure 604.

WARNING: ALKALINE GEL WILL CAUSE BURNS TO EXPOSED SKIN. COVER EXPOSED SKIN. SEE MATERIAL SAFETY DATA SHEETS FOR MORE INFORMATION.

(a) Apply SPOP 2 alkaline gel with a Air Powered Degreasing/Spray Gun, #4Z668.

1 Apply the alkaline gel into the two (2) holes at the 6 o'clock position for 45 − 60 seconds each.

NOTE: Do not over fill the cavity. The intent is to coat the interior surface with the gel.

2 Seal the two (2) holes with rubber plugs.

3 Apply the alkaline gel into the other nine (9) holes for 45 − 60 seconds each. Do not plug the holes.

4 Allow the alkaline gel to soak for 45 − 60 minutes.

5 Repeat steps 1, 2 and 3.

6 Allow the alkaline gel to soak for 4 − 24 hours.

(b) Drain the SPOP 2 alkaline gel.

1 Remove the two (2) plugs at the 6 o'clock position.

2 Collect the alkaline gel in a bucket.

3 Siphon the gel that remains with the Hand Suction Gun, #6Y831.

4 Flush fully the No. 4 bearing compartment with hot water 170° − 180°F (76.7° − 82.2°C) pressure spray until clear water runs out.

NOTE: The Air Powered Degreaser/Spray Gun, #4Z668, may be used for the hot water spray flush.

5 Siphon the water from the compartment and empty it into a bucket.

NOTE: The flush process can use up to five (5) gallons of hot water to insure the compartment is fully cleaned.

CAUTION: MAKE SURE THE ALKALINE GEL IS FULLY FLUSHED FROM THE COMPARTMENT.

6 If the final flush water feels slippery when compared to tap water, some alkaline gel cleaner remains. Repeat the flush process until the water does not have a slippery feel.

(5) Clean the pressure and the scavenge tubes. Refer to SPOP 2.

NOTE: For an optional method to clean the pressure and the scavenge tubes, refer to SPOP 201, 203 or 209.

(a) Clean and flush the tubes as specified in step (4).

(6) Fully dry the No. 4 bearing compartment and the pressure and the scavenge tubes with filtered compressed air.

(7) Remove all rubber seals, tape, cloth and cover from the LPT shaft.

(8) Carefully flush any cleaner that remains from the LPT ares. Fully dry the area with air and a lint free cotton cloth.

(9) Repeat steps (3) thru (8) if any coking remains.

ENGINE GENERAL − TURBINE EXHAUST CASE − INSPECTION/CHECK−01

Task 72−00−54−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
819	B	Front Compressor Drive Turbine (LPT) Shaft (72−53−80) Stage 6 LPT Airseal (72−53−85) (See Figure 801)				
		Shaft	6.8595 (174.232)	6.8605 (174.256)		
		Airseal	6.857 (174.168)	6.859 (174.218)	.0005T (0.013T)	.0035T (0.088T)
820	B	Front Compressor Drive Turbine (LPT) Shaft (72−53−80) Stage 6 LPT Airseal (72−53−85) (See Figure 801)

ENGINE GENERAL − TURBINE EXHAUST CASE − INSPECTION/CHECK−03

Task 72−00−54−210−001:

1. Inspect EGT (TT4.95) Thermocouple Housing
   A. Prerequisites
      (1) Remove EGT (TT4.95) Thermocouple Housing per Removal−07 (Task 72−00−54−050−005).
   B. Equipment And Materials Required − None
   C. Visual Inspection
      See Figures 801 and 802.
      (1) Inspect probe housing for nicks, dents cracks and deformation. See Figure 801.
         (a) Nicks and dents are acceptable.
         (b) Deformation due to heat is acceptable provided assembly into engine or thermocouple installation is not affected.
         (c) Cracked probe housings should be rejected.
      (2) Inspect three temperature sampling tubes and six slots on leading edge or probe casting for obstructions to flowpath. Line of sight flowpath to probe slots on leading edge of housing should be maintained.
      (3) Three temperature sampling discharge slots on probe housing, trailing edge should be open to minimum width and length shown in Figure 802 (Indexes 2 and 1) as viewed from the rear.
      (4) The temperature sensing slots on probe leading edge and surrounded by inlet tubes must be open to minimum width and length shown in Figure 802 (Indexes 3 and 5) as viewed from the front.
   D. Postrequisites
      (1) Install EGT (TT4.95) Thermocouple Housing per Installation−07 (Task 72−00−54−450−005).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSPECTION/CHECK−04

Task 72−00−54−210−002:

1. Inspect Exhaust Gas Average Pressure (And Thermocouple Housing) PT4.95 Probe
   - A. Prerequisites
     - (1) Remove Exhaust Gas Average Pressure (and thermocouple housing) PT4.95 Probe per Removal−03 (Task 72−00−54−050−001).
   - B. Equipment And Materials Required − None
   - C. Visual Inspection

     See Figures 801 and 802.
     - (1) Inspect probe for nicks, dents, cracks and deformation. See Figure 801.
       - (a) Nicks and dents are acceptable.
       - (b) Deformation due to heat is acceptable provided that assembly into the engine and thermocouple installation is not affected.
       - (c) Cracked probes should be rejected.
     - (2) Inspect probe pressure port for thread damage. Repair thread as required.
     - (3) Inspect temperature sampling tubes and slots in leading edge of probe casting for obstructions to flowpath. Line of sight flowpath to probe slots on leading edge of probe should be maintained.
     - (4) Six pressure sampling ports on leading edge of probes must be open to minimum of Figure 802 (Index 6). It is permissible to use a 0.030 inch (0.762 mm) diameter hand−held drill to unplug holes, or clean per Cleaning−XX.
     - (5) The temperature sensing slots on probe leading edge and surrounded by an inlet tube must be open to minimum width and length shown in Figure 802 (Indexes 3 and 5) as viewed from the front.
     - (6) Three temperature sampling discharge slots on probe trailing edge should be open to minimum width and length shown in Figure 802 (Indexes 2 and 1) as viewed from the rear.
   - D. Postrequisites
     - (1) Install Exhaust Gas Average Pressure (and thermocouple housing) PT4.95 Probe per Installation−03 (Task 72−00−54−450−001).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSPECTION/CHECK−05

Task 72−00−54−210−003:

1. Visually Inspect EGT (TT4.95) Thermocouple
    - A. Equipment And Materials Required − None
    - B. Procedure
        - (1) Inspect exposed surfaces of thermocouple for cracks.
        - (2) Reject thermocouples with cracks.

          NOTE: Minor nicks are not cause for rejection.

        - (3) Inspect terminals for looseness or thread damage.
    - C. Postrequisite Procedures
        - (1) Check continuity and electrical insulation resistance per Testing−01 (Task 72−00−54−750−001).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - INSPECTION/CHECK-06

Task 72-00-54-210-004:

1. Inspect EGT (TT4.95) Box And Cable
    A. Equipment And Materials Required - None
    B. Procedure
        (1) Check EGT box and cable for evidence of damage to steel braid and to terminals.
        (2) Defective or rejected EGT box and cable fall into two basic categories.
            (a) Damaged or frayed braid.
            (b) Damaged or broken terminals and/or brackets.

NOTE: Replace left or right thermocouple cable, as required.

    C. Postrequisite Procedures
        (1) Check continuity and electrical insulation resistance per Testing-02 (Task 72-00-54-750-002).

Task 72-00-54-200-001:

1. No. 4 Bearing Compartment Vacuum Check

A. Equipment And Materials Required

Standard Tools:
CTE 6075 Vacuum Cart
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Special Tools:
PWA 85843 Adapter
PWA 85978 Plug, Vacuum Check

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/12/230

B. Procedure

See Figure 801.

(1) Disconnect and loosen the (LR06) No. 4 bearing oil scavenge tube assembly.

(a) Remove the bolt, nut and clamp which holds the spray shield to Flange M bracket at approximately the 7 o'clock position. Remove the hose clamp from the forward end of the spray shield and remove the shield from the engine. Remove the lockwire and disconnect the tube nut from the tube coupling.

(b) Remove the lockwire and disconnect the tube elbow from the exhaust case internal tube nut approximately the 10 o'clock position.

(c) Remove the bolts, nuts and clamps which hold the tube to the Flanges N and P brackets. Close the tube openings for protection.

(d) Remove the bolt, spacer, nut and clamp which holds the tube to the adjacent scavenge tube.

(2) Install PWA 85843 Adapter into the tube coupling nut.

(3) Remove the No. 4 bearing strainer housing.

(a) Remove the hose clamp which holds the spray shield to the rear tube connection on the exhaust case at approximately the 10:30 o'clock position. Remove the shield from the engine. Remove the lockwire and disconnect the tube nut from the strainer housing.

(b) Remove the lockwire and disconnect the strainer housing from the exhaust case internal tube nut at approximately the 10:30 o'clock position.

(c) Close the tube openings for protection.

(4) Install PWA 85978 Plug into the tube coupling nut.

(5) Attach the vacuum hose and the pressure line to the CTE 6075 Vacuum Cart.

(6) Set the vacuum cart pressure at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute). Find the airflow leakage rate into the No. 4 bearing compartment. The maximum airflow leakage is 10 PPH (4.54 kg per hour).

NOTE: During the vacuum test, and except as specified in this procedure, all the oil supply tubes, breather tubes, and scavenge tubes must be installed. During the vacuum test gearbox covers for the integrated drive generator and both hydraulic pump pads must be installed.

(7) Remove PWA 85843 Adapter from the coupling nut. Close the tube openings with standard shop fittings.

(8) Install the No. 4 bearing strainer housing.

(a) Install the strainer housing, threads lubricated with Engine Oil P03−001, to the exhaust case internal tube nut at approximately the 10:30 o'clock position, tighten by hand.

(b) Install the (LP16) No. 4 bearing oil pressure tube assembly to the strainer housing. Install the tube, threads lubricated with Engine Oil P03−001, to the strainer housing on the exhaust case, tighten by hand.

(9) Connect and clamp the (LR06) No. 4 bearing oil scavenge tube assembly.

(a) Remove protection and install tube elbow with
R nut threads lubricated with Antiseize Paste
R P06−054, to the exhaust case internal tube nut at
approximately the 10 o'clock position, and to the
tube coupling forward of Flange M at approximately
R the 7 o'clock position, tighten by hand. Remove
R unwanted paste.

(b) Install the clamps, bolts, threads lubricated with Engine Oil P03−001, and nuts which hold the tube to Flanges N and P brackets. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install the clamp, bolt, threads lubricated with Engine Oil P03−001, spacer, and nuts to hold the (LR06) tube to the adjacent (LP16) No. 4 bearing oil pressure tube assembly.

(d) Torque the tube nut at the exhaust case connection to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Torque the tube nut at Flange N connection to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(f) (Reference 2151) Install the spray shield to the inboard side of Flange N connection and attach the forward end of the shield with a hose clamp. Torque hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(g) Secure the clamp to the rear end of the shield and Flange M bracket with a bolt, threads lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(10) Torque the (LP16) No. 4 bearing oil pressure tube nut to the strainer housing. Torque the tube nut to 450 − 500 lb−in. (50.843 − 56.492 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(11) Torque the exhaust case internal tube nut to the last chance strainer housing to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(12) (Reference 2151) Install the spray shields to the inboard side of the front and rear connections and attach with hose clamps. Torque the hose clamps to 15 − 18 lb−in. (1.695 − 2.034 N.m).

ENGINE GENERAL − TURBINE EXHAUST CASE − INSPECTION/CHECK−08

Task 72−00−54−210−005:

1. Visually Inspect Turbine Exhaust Case, Pressure And Scavenge Tubes

   A. Equipment And Materials Required − None

   B. Procedure

      (1) Check the turbine exhaust case, the pressure tube and the scavenge tube for coking.

      (2) Excessive coking must be removed. Refer to 72−00−54 Cleaning−03, Clean Coke From The Turbine Exhaust Case, Pressure And Scavenge Tubes (Task 72−00−54−110−001).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - TURBINE EXHAUST CASE - TESTING-01

Task 72-00-54-750-001:

1. Test EGT (TT4.95) Thermocouple
   A. Equipment And Materials Required

      Standard Tools:

Name	Manufacturer
Electronic Multimeter Model 2795	Simpson Electric Co. American Gage & Machine Co. (Katy Industries Inc.), 853 Dundee Avenue Elgin, IL 60120

   B. Procedure
      (1) Continuity and insulation resistance test. See Figure 1301.

         NOTE: Before performing any of the following tests, be sure that thermocouple has been satisfactorily cleaned per Cleaning-01 (Task 72-00-54-160-001).

         (a) Apply heat at junctions of thermocouples with heat source.
         (b) Check for continuity by using low voltage ohmmeter at terminal posts. Deflection of needle on low voltage ohmmeter shows continuity in thermocouple circuits.
         (c) Using low voltage ohmmeter, check insulation resistance between both chromel and alumel terminals and body of thermocouple for minimum of 25 seconds for each measurement. Resistance must be at least 50,000 ohms. If resistance is within limits thermocouples shall be returned to service.

            NOTE: Low voltage ohmmeter utilizing less than 40 volts (DC) and maintained at accuracy of five percent shall be used for determining insulation resistance.

      (2) Defective or rejected thermocouples fall into three basic categories.
         (a) No continuity in circuit.
         (b) Shorted circuit.
         (c) Low insulating resistance.
      (3) Check for secondary junctions
         (a) Apply heat gun to head of thermocouple to 600° - 700°F (316° - 371°C).

(b) Check for deflection of milli−voltmeter at each set of studs. Milli−voltmeter should not deflect.

ENGINE GENERAL - TURBINE EXHAUST CASE - TESTING-02

Task 72-00-54-750-002:

1. Test EGT (TT4.95) Box And Cable

A. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Electronic Multimeter Model 2795	Simpson Electric Co. American Gage & Machine Co. (Katy Industries Inc.) 853 Dundee Avenue Elgin, IL 60120

B. Procedure
See Figure 1301 and Figure 1302.

(1) General

(a) Validity of electrical tests made in field may depend upon limitations inherent in common ohmmeter. This instrument is not dependable for determining exact wire resistances of thermocouple box and cable. It may, however, be used to detect gross failures such as open or intermittent circuits, and metal-to-metal short circuits. Also, approximate insulation resistance may be checked if certain precautions are observed. Ohmmeter used in following tests must be of good quality and in good condition; i.e. free from "stickiness" of meter needle, with pinjacks firm, test leads sound, and dry cells in condition to permit full scale deflectoin for all positions of range switch.

(2) Prepare cable for test.

(a) Tag all thermocouple cable leads to ensure proper reinstallation.

NOTE: Nut and stud diameters of alumel terminals are larger than those of chromel terminals.

(b) Remove nuts and lockwashers from probe stud terminals and remove cable leads.

(c) Remove bolts attaching junction box cover to junction box and remove covers.

(d) Disconnect averaging circuit leads from junction box terminals (Circuit A and Circuit B). Each circuit has two pair of leads and shields. Separate each pair in each circuit and label.

(3) Continuity check.

(a) Set ohmmeter range switch to range which has center scale value of approximately 10 ohms.

NOTE: Broken wires which come into contact intermittently due to flexing will cause needle to fluctuate. False intermittent indications will result if ohmmeter prods are not in firm contact with clean terminals; also, if ohmmeter prods, leads, or jack are defective.

(b) Perform continuity check per referenced schematic.

(c) Reject any assembly for discontinuity.

(4) Check insulation resistance.

(a) Using low voltage ohmmeter, check insulation for short circuits, excessive leakage, and internal insulation chafing discrepancies. Check proper operation of instrument by touching test prods together and noting needle deflection to read zero ohms.

NOTE: Low voltage ohmmeter utilizing less than 40 volts (DC) and maintained at accuracy of five percent shall be used for determining insulation resistance.

(b) Place one prod in contact with cable steel braid covering and other prod in contact, respectively, with junction box studs as follows. See Figure 1301.

1 Alumel, T/C 3 and TC/4, Circuit A

2 Alumel, T/C 2 and T/C 1, Circuit A

3 Chromel, T/C 5 and T/C 4, Circuit A

4 Chromel, T/C 2 and T/C 1, Cirucit A

(c) Repeat step (b) for Circuit B.

(d) Read ohmmeter. If resistance recorded is below 50,000 ohm, proceed as follows: If full−scale deflection (zero ohms) is recorded and no terminals are in accidental contact, reject part. If larger (but not full−scale) deflection is recorded, presence of carbon or excessive moisture may be indicated. Carbon yields fairly steady reading. Moisture tends to produce readings which waver or drift after 5 − 30 seconds. If presence of moisture is indicated, bake cable at 220° − 250°F (104° − 121°C) for one hour and recheck.

NOTE: False drift may be due to variations in applied voltage. To check for false drift, place prods in contact with each other for ten seconds. Readings must not wander from full−scale deflection.

(e) Perform resistance check of insulation between conductors using low voltage ohmmeter. Place one prod on alumel Circuit A output stud and other prod on chromel Circuit A output stud. If resistance recorded is below 50,000 ohms, reject part.

(f) Repeat step (e) for Ciucuit B.

(5) Short circuit check.

(a) Set ohmmeter range switch to range which has center scale value of approximately 10 ohms.

(b) Place prods respectively as described in paragraphs (4)(b), (c), (e), and (f). Flex cable gently along entire length of conductors under test and observe instrument needle. If any deflection results (unless caused by accidental contact between other terminals of cable), reject part.

(6) Defective or rejected thermocouple box and cable falls into three basic categories.

(a) No continuity in circuit.

(b) Shorted cirucuit.

(c) Low insulation resistance.

(7) Restore to pretest configuration.

(a) Connect averaging circuit leads to thermocouple junction box terminals.

1 (Reference 2273) Torque chromel (smaller) nuts on terminals to 15 − 18 lb−in. (1.695 − 2.034 N.m).

2 (Reference 2273) Torque alumel (larger) nuts on terminals to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(b) Position junction box cover on junction box, install attaching bolts and lockwire.

(c) Position termocouple cable leads on probe stud terminals, install lockwashers and nuts.

1 (Reference 2273) Torque chromel (smaller) nuts on terminals to 15 − 18 lb−in. (1.695 − 2.034 N.m).

2 (Reference 2273) Torque alumel (larger) nuts on terminals to 18 − 22 lb−in. (2.034 − 2.486 N.m).

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-01

Task 72-00-61-020-001:

1. Remove Main Gearbox

A. Prerequisites

(1) Remove fuel pump and fuel metering unit (package) per Removal-05 (Task 72-00-61-050-003).

(2) Remove exciter-to-igniter plug cable (upper plug-upper box), per 72-00-41, Removal-04 (Task 72-00-41-050-001).

(3) Remove exciter-to-igniter plug cable (lower plug-lower box), per 72-00-41, Removal-05 (Task 72-00-41-050-002).

(4) Remove ignition exciters per Removal-03 (Task 72-00-61-050-001) and Removal-04 (Task 72-00-61-050-002).

(5) Disconnect EEC core engine wiring harnesses W3, W4 and W5 from main gearbox, per Removal-34 (Task 72-00-61-050-015).

(6) Disconnect/remove external parts for access to main gearbox per Removal-02 (Task 72-00-61-020-002).

(7) Remove the No. 3 bearing breather and restrictor valve. See Removal-39 (Task 72-00-61-050-019).

(8) Remove the magnetic chip detector assemblies from the oil tank and main gearbox. Refer to Removal-36 (Task 72-00-61-050-017).

B. Equipment And Materials Necessary

Special Tools:

PWA 80611	Jack, Hydraulic
PWA 85123	Fixture (Optional to PWA 86056 Fixture)
PWA 86056	Fixture

NOTE: Hydraulic Jack (PWA 24667) may be used in place of (PWA 80611) if adapted to fit Fixture (PWA 85123).

C. Procedure
See Figures 301, Figure 302, and Figure 303.

(1) Remove lockwire and bolts (301/2) securing gearbox driveshaft (front) housing brackets (302/1) and (302/2) to high pressure compressor.

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−01

CAUTION: USE OF SCREWDRIVER, OR SIMILAR TOOL, TO SEPARATE HOUSING FROM GEARBOX MAY RESULT IN DAMAGE TO SEALING SURFACES.

(2) Remove bolts (302/10), nuts (302/15), and washers (302/11) and (302/16) securing gearbox driveshaft (front) housing (302/3) to angle gearbox (302/17). Move housing (302/3) rearward. Discard packing (302/13). See Figure 302.

(3) Remove retaining ring (302/14) securing gearbox driveshaft (302/12) to gearbox drive coupling (302/18). Slide driveshaft rearward into main gearbox.

(4) Align boltholes and position PWA 86056 or PWA 85123 Fixture to lifting pad of PWA 80611 Hydraulic Jack. Secure fixture to jack with three detail screws. See Figure 301.

(5) Position jack under engine and raise jack to position four post details of fixture to four ground handling points of gearbox. Secure post−details to gearbox with four detail bolts (301/1).

(6) Remove cotter pin (302/4), nut (302/5), and bolt (302/7) securing support link (302/6) to gearbox driveshaft housing (302/8).

(7) Remove cotter pin (303/11), nut (303/15), pin (303/14), bolt (303/10), washer (303/12) and spacer (303/13) that attach the support link (303/8) to lugs on upper wall of left and right sides of gearbox. Discard the washers (303/12). Remove the jack and gearbox. See Figure 303.

(8) If necessary, remove the support links (303/8) from the engine as follows.

(a) Remove cotter pin (303/7), nut (303/1), pin (303/2), bolt (303/6), washer (303/5), and spacer (303/4) that attach the support link (303/8) to the gearbox support clevis (303/3) on each side of the engine.

(b) Remove the support links. Discard the washers (303/5).

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−01

(9) Temporarily secure the spherical bearings (303/9) in the support links (303/8) for the gearbox and the support link (302/6) for the gearbox driveshaft housing.

CAUTION: CARE SHOULD BE TAKEN NOT TO DAMAGE SPLINES ON FRONT AND REAR ENDS OF DRIVESHAFT.

(10) Withdraw gearbox driveshaft (302/12) and driveshaft (front) housing (302/3). Discard packing (302/9).

(11) Position nylon sling through boltholes in gearbox support lugs on upper left and right sides of gearbox housing and attach to hoist. Load hoist.

(12) Remove bolts securing gearbox to gearbox handling fixture. Remove gearbox from fixture.

(13) Lift and move main gearbox to pallet. Remove hoist and sling.

(14) Install protective covers over gearbox driveshaft housing and opening in angle gearbox.

Main Gearbox Removal
Figure 303
(Task 72−00−61−020−001)

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−02

Task 72−00−61−020−002:

1. Remove The Main Gearbox Plumbing Prior To The Main Gearbox Removal

A. Equipment And Materials Required − None

B. Procedure

(1) (Post SB PW4ENG 72−491) Remove the deoiler idler bearing pressure line (LP35) as follows. See Figure 301.

(a) Remove the spray shield from the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15).

(b) Remove the clamps that attach the line to the overboard breather pad bracket and the oil tank mount flange bracket.

(c) Loosen the line nuts at the tee fitting and the deoiler (idler) spur gear assembly in the gearbox.

(d) Carefully remove the line and install the protective closures.

(2) Remove the No. 1, 1.5, and 2 bearing oil scavenge tube assembly (LR03) as follows. See Figure 302.

(a) Remove the lockwire. Disconnect the tube nut at 7 o'clock position adjacent to Flange E.

(b) Remove the three bolts that attach the rear of the tube to the main oil pump.

(c) Remove the bolts, nuts, and clamps that attach the tube to the HPC case bracket and the gearbox brackets.

(d) Remove the tube. Discard the packing.

(e) (Post SB PW4ENG 79−58), Remove the strainer element from the flanged−end of the tube.

(f) Install protection covers to the tube ends.

(3) Remove angle gearbox oil scavenge tube assembly (LR01) as follows.

(a) Remove the four bolts that attach the tube to the angle gearbox and the main oil pump.

(b) Remove the bolts, nuts, and clamps that attach the tube to the gearbox brackets.

(c) Remove the tube. Discard the packings. Install the covers.

(4) (Pre SB PW4ENG 79-75) Remove the (front) No. 4 bearing oil scavenge tube assembly (LR05) (if not done before) as follows. See Figure 302.

(a) Remove the bolt, nut, and clamps that attach the spray shield to the tube connection at 7 o'clock position adjacent to Flange M. Remove spray shield.

(b) Remove the lockwire. Disconnect the tube nut at the same connection.

(c) Remove the three bolts that attach the tube to main oil pump.

(d) Remove the bolts, nuts, and clamps that attach the tube to the adjacent oil tubes and the oil pump bracket.

(e) Remove the tube. Discard the packings. Remove the six (clip-on) loop clamp grommet halves (Post SB PW4ENG 79-46 only). Install the protection covers.

(5) (Post SB PW4ENG 79-75) Remove (front) No. 4 bearing oil scavenge hose and tube assembly (LR05) as follows. See Figure 302.

(a) Remove the bolts, nuts and clamps that attach the hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or adapter.

NOTE: Catch oil in container with a capacity of approximately 5 U.S. gallons (19 liters).

(b) Remove lockwire from the tube nut to the main oil pump connection. Remove bolts securing tube to main oil pump and remove tube from engine.

(c) Remove and discard packing. Install protective closures.

(d) Remove the bolts that secure the loop clamp bracket to the TCC manifold bridge bracket. Remove the loop clamp bracket.

(6) (Pre SB PW4ENG 79-75) Remove the No. 3 bearing oil scavenge manifold assembly (LR04) as follows. See Figure 302.

(a) Remove the lockwire. Disconnect the diffuser case internal tube nut from the manifold elbow at 6 o'clock position.

(b) Remove the three bolts that attach the manifold to main oil pump.

(c) Remove the tube. Discard the packing. Remove the two (clip-on) loop clamp grommet halves (Post SB PW4ENG 79-46 only). Install the protection covers.

(d) Remove the tube. Discard the packing. Remove the two (clip-on) loop clamp grommet halves (Post SB PW4ENG 79-46 and Pre SB PW4ENG 79-75 only). Install the protection covers.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER TUBE AND LEAKS OR TUBE RUPTURE CAN BE
R THE RESULT.

(7) (Pre SB PW4ENG 79-75) Remove the main filter oil tube assembly (LP01) (if not done before) as follows. See Figure 302 (Sheets 1 through 7).

(a) Remove the bolts that attach the tube to the main oil filter housing and the main oil pump. Remove the bracket from the tube flange at the oil pump connection.

(b) Remove the bolts, nuts, and clamps that attach the tube to the gearbox brackets and the diffuser case bracket.

(c) Remove the tube. Discard the packings. Remove the six (clip-on) loop clamp grommet halves (Post SB PW4ENG 79-36 only). Install the covers.

(d) Remove the bolt, nut, and clamp that attach the tube to the fuel/oil cooler rear mount bracket (Pre SB PW4ENG 72-211 only).

(e) Remove the two bolts, nut, and two clamps that attach the tube to the fuel/oil cooler rear mount bracket and to the adjacent No. 3 bearing oil pressure manifold (Post SB PW4ENG 72-211 only).

(f) (Post SB PW4ENG 79-52), Remove the bolt, nut and clamp that attaches the tube to a bracket on the flange of the secondary flow control valve.

(g) Remove the tube. Discard the packing. Install the covers.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(8) (Post SB PW4ENG 79-75) Remove main oil filter hose and tube assembly (LP01) (if not done before) and the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86) as follows. See Figure 302.

(a) Remove bolts securing tube to front of main oil filter housing.

(b) Remove the bolts that hold the tube to top of the fluid pressure dampener or adapter.

(c) Remove bolt, nut and clamp securing tube to diffuser case bracket at approximately 7 o'clock position.

(d) Remove bolts, nuts and clamps securing tube to gearbox brackets and remove tube from engine.

(e) Remove the bolts that hold the fluid pressure dampener or adapter to the top of the main oil pump.

(f) Remove the bolts and nuts that hold the loop clamp bracket to the fluid pressure dampener or adapter. Remove the bracket.

(g) Remove the dampener or adapter from the engine.

(h) Discard packings from the hose and tube assembly and the filter.

(9) Remove the air cooler inlet oil tube assembly (LP02) as follows.

(a) Remove the three bolts that attach the rear of the tube to the top of the oil filter housing.

(b) Remove the three bolts that attach the front of the tube to the air oil cooler.

(c) Remove the tube. Discard the packings. Install the covers.

(10) Disconnect and disengage the (lower) No. 1 and 2 bearing breather tube assembly (LB02) as follows.

(a) Remove the bolt, nut, and clamp that attach the tube to the Flange H bracket at 8:30 o'clock position.

(b) Remove the bolt, nut and clamp that attaches the No. 1 and 2 bearing breather tube (lower) (LB02) to the inboard oil cooler bracket (Post SB PW4ENG 79−33).

(c) Remove the three bolts and bracket that attach the tube to the front of the gearbox.

(d) Disengage the tube from the gearbox and temporarily attach the tube away from the gearbox with some lockwire.

(e) Discard the packings. Install the covers.

(11) Disconnect and disengage the No. 3 bearing breather tube assembly (LB04) as follows.

(a) Remove the lockwire. Disconnect the tube nut from the tube coupling at 9:30 o'clock position adjacent to Flange K.

(b) (Pre SB PW4ENG 75-95), Remove the three bolts that attach the tube to the front of the main gearbox.

(c) (Post SB PW4ENG 75-95 and Pre SB PW4ENG 75-144) Remove the three bolts that attach the tube to No. 3 bearing breather restrictor valve that is located on the front of the main gearbox.

(d) Remove the bolt and clamp that attach to the tube to the bracket attached to the fuel/oil cooler rear support (Pre SB PW4ENG 72-211 only).

(e) Remove the bolt, nut, and clamp that attach the tube to the bracket attached to the HPC air valve (Post SB PW4ENG 72-211 only).

(f) Disengage the tube from the front of the main gearbox. Temporarily attach the tube away from the gearbox with some lockwire. Discard the packing. Install the covers.

(12) (Post SB PW4ENG 75-95 and Pre SB PW4ENG 75-144) Remove the No. 3 bearing breather valve air supply tube (AP39) from the engine as follows. See Figure 304.

(a) Remove the lockwire from the tube nut that is attached to the No. 3 bearing breather and restrictor valve on the front right side of the main gearbox. Disconnect the tube nut from the valve.

(b) Remove the lockwire from the tube nut that is attached to the No. 3 bearing cooler air tube (AP34) located approximately at the 4 o'clock position on the high compressor case. Disconnect the tube nut from the cooler air tube (AP34).

(c) Remove the bolt, nut and clamp that attaches the tube to the clamp on the oil cooler outlet fuel tube (FM11).

(d) Remove the bolt and clamp that attaches the tube to a bracket on the gearbox driveshaft housing, support link mount on the high compressor.

(e) Remove the bolt and clamp from the bracket that is attached to the tube flange of the air vent diffuser seal tube (AP21).

(f) Remove the tube from the engine and install protection covers to the tube openings.

(13) Remove the bolt that attaches the ground cable to the oil tank flange. Install the bolt again and tighten by hand. If diffuser case removal is planned, remove the lockwire and the bolt that attaches the ground cable to the case. Install the bolt again and tighten by hand.

Task 72-00-61-050-001:

1. Remove Ignition Exciter (Lower Exciter)
   A. Equipment And Materials Required - None
   B. Procedure
      See Figures 301 and 302.

WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

(1) Remove the bolt and nut that attaches a clamp on the lower igniter cable to a bracket located between the upper and lower igniter cables.
(2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove heat shields from cable.
(3) Loosen the clamps that attaches the heat shield segments at the exciter end of the cable. Remove heat shields from cable.
(4) Loosen the cable coupling nut from the lower exciter at the inboard connector. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

(5) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from cable.

Exciter−To−Igniter Plug Cable
Figure 302
(Task 72−00−61−050−001)

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−03

(6) Disconnect igniter cable from lower exciter at inboard connector. Remove heat shield clamps from cable.
(7) Remove three bolts, washers, and nuts securing exciter to mount bracket and remove exciter, entrapped in heat shields from engine.
(8) Remove grommets from exciter−to−igniter plug cable ends and discard.
(9) Remove heat shields from exciter.
(10) Remove seal from exciter input (smaller) connector. Discard seal and install protective closures.

NOTE: Additional information concerning detailed maintenance of this component may be found in Ignition Exciter Component Maintenance Manual, 74−11−04 (Bendix Aerospace).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-04

Task 72-00-61-050-002:

1. Remove Ignition Exciter (Upper Exciter)

   A. Equipment And Materials Necessary - None

   B. Procedure
   See Figure 301 and Figure 302.

   WARNING: IGNITION SYSTEM VOLTAGE IS DANGEROUSLY HIGH. IGNITION SWITCH MUST BE IN THE OFF POSITION BEFORE REMOVAL OF ANY IGNITION COMPONENTS. ALLOW SEVERAL MINUTES TO ELAPSE BETWEEN OPERATION OF THE IGNITION SYSTEM AND THE REMOVAL OF COMPONENTS. UPON DETACHING THE CABLE FROM THE IGNITER PLUG, DISCHARGE THE CURRENT BY GROUNDING THE CABLE TERMINAL TO ENSURE COMPLETE DISSIPATION OF ENERGY FROM THE SYSTEM. FAILURE TO FOLLOW THIS PROCEDURE COULD RESULT IN SEVERE INJURY TO PERSONNEL.

   (1) Remove the bolt and nut that attaches a clamp on the upper igniter cable to a bracket located between the upper and lower igniter cables.

   (2) Loosen the clamp that attaches the heat shield segments at the igniter plug end of the cable. Remove heat shields from cable.

   (3) (Post SB PW4ENG 73-192) Loosen the clamps that attach the cooling hoses to the heat shield at the exciter end of the cable. Remove cooling hoses from heat shield.

   NOTE: Pre SB PW4ENG 73-192 engines do not have W5/W6 wiring harness connector cooling.

   (4) Loosen the clamps that attaches the heat shield segments at the exciter end of the cable. Remove heat shields from cable.

   (5) Loosen the cable coupling nut from the upper exciter at the outboard connector. The coupling nut should only be loose sufficiently to permit free movement of the cable, not removal of the cable.

   WARNING: FOR MORE PROTECTION FROM A DANGEROUS ELECTRICAL CHARGE DISCONNECT THE COUPLING NUT

FROM THE IGNITION PLUG AND TOUCH THE CABLE END TO THE IGNITER PLUG BODY SHIELD.

CAUTION: REMOVE THE CABLE ENDS (LEADS) FROM THE IGNITER PLUG AND THE IGNITION EXCITER BY PULLING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(6) Disconnect the cable coupling nut from the igniter plug and touch the cable end against the igniter plug casing (body) to decrease to zero any remaining electrical charge. Remove the heat shield clamp from cable.

(7) Disconnect igniter cable from upper exciter at outboard, connector. Remove heat shield clamps from cable.

(8) Remove three bolts, washers, and nuts securing exciter to mount bracket and remove exciter, entrapped in heat shields, from engine.

(9) Remove grommets from exciter−to−igniter plug cable ends and discard.

(10) Remove heat shields from exciter.

(11) Remove seal from exciter input (smaller) connector. Discard seal and install protective closures.

NOTE: Additional information concerning detailed maintenance of this component may be found in Ignition Exciter Component Maintenance Manual, 74−11−04 (Bendix Aerospace).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-05

Task 72-00-61-050-003:

1. Remove Fuel Pump And Fuel Metering Unit (Package)

A. Prerequisites

(1) Remove fuel bypass valve per 72-00-61, Removal-08 (Task 72-00-61-050-005).

B. Equipment And Materials Necessary

Special Tools:
PWA 85862 Adapter, Torque
PWA 85989 Fixture, Handling (Optional)
PWA 86461 Adapter, Torque

C. Procedure
See Figure 301, Figure 302 and Figure 303.

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTIONS USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(1) Disconnect W4P2 and W5P1 harness connectors from fuel metering unit. Install protective closures.

(2) Remove lockwire and disconnect fuel distribution valve supply tube assembly (FM09) from adapter on fuel metering unit and from adapter on fuel flowmeter.

(3) Remove bolts, nut, and clamps securing tube to HPC case bracket and airframe cooler oil outlet tube. Remove tube from engine. Discard packings and retainers.

(4) (Pre SB PW4ENG 73-84), Disconnect W5P8 connector from fuel temperature probe located at top, outer side of fuel pump filter housing.

(5) (Post SB PW4ENG 73-84), Remove the harness connector from the thermocouple probe as follows.

(a) Remove the nuts that attach the W5 wiring harness to the studs on the thermocouple.

(b) Remove the bolt, clamp, and ground strap that are attached to the bracket on the fuel pump filter housing.

(c) Remove the wiring harness terminals from the thermocouple studs.

(d) Install protection covers.

(6) For engines not equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Pre SB PW4ENG 73-35), remove lockwire and disconnect the tube assembly from rearward inboard adapter on fuel pump. Remove three bolts securing threaded adapter to pump. Slide adapter out of pump port and down tube as far as possible.

(7) For engines equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Post SB PW4ENG 73-35), remove three bolts securing hose and tube assembly to rearward inboard port on fuel pump. Disengage hose and tube assembly flange from pump and discard packing.

(8) Remove bolts securing oil cooler inlet fuel tube (FM10) flange to fuel pump pad just forward of outlet fuel tube.

(9) For ease of removal, install the PWA 85989 Handling Fixture to the fuel pump. Attach it with the two detail bolts and the handscrew.

(10) Using PWA 85862 Torque Adapter, loosen and remove antirotation bolt from hole in base flange of fuel pump at approximately 7 o'clock position.

CAUTION: DO NOT ALLOW WEIGHT OF FUEL PUMP AND FUEL METERING UNIT PACKAGE TO BE TRANSMITTED TO PUMP SPLINES DURING REMOVAL OR DAMAGE TO SPLINES MAY RESULT.

(11) Use PWA 86461 Torque Adapter to loosen the bolt at the 1 o'clock position and PWA 85862 Torque Adapter to loosen the remaining bolts securing fuel pump to gearbox drive until captured washers are clear of flange. Rotate pump clockwise (viewed from front) to

disengage flange holes from bolts and oil cooler inlet fuel tube flange from pump.

(12) Move fuel pump and fuel metering unit forward to disengage drive spline and bolts. Lower package from engine.

(13) Remove packings from groove on drive spline and flange of fuel pump. Remove package from fixture (if used).

(14) Remove and discard packing from groove at flanged end of inlet tube.

(15) For engines not equipped with flexible oil cooler outlet fuel hose and tube assembly (Pre SB PW4ENG 73-35), comply with the following.

(a) Remove adapter from oil cooler outlet fuel tube. Remove and discard packing from adapter.

(b) Remove packing and retainer from oil cooler outlet tube. Uncrimp key washer and remove coupling nut, ferrule, and key washer. Discard packing, retainer, and key washer.

(16) Install protective closures to all openings.

NOTE: For additional information concerning detailed maintenance of fuel metering unit see Fuel Metering Unit Component Maintenance Manual, 73-21-38 (Hamilton Standard Division).

NOTE: For additional information concerning detailed maintenance of fuel pump see Fuel Pump Component Maintenance Manual, 73-11-04 (TRW).

Task 72-00-61-050-016:

1. Remove Fuel Metering Unit

A. Equipment And Materials Necessary

Consumable Materials:

	Item No.	Designation
R	P03-001	Lubricant, Aircraft Turbine Engine
R		(Synthetic Base) (PWA 521B)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing (TRW)	1	73-12-00/2/60

Lockwire, MS20995C32 (TRW) or AS3214-02

B. Procedure
See Figure 301, Figure 302, and Figure 303.

NOTE: This procedure is for removal of the fuel metering unit from the fuel pump while fuel pump remains on engine. For removal of fuel pump and fuel metering unit as a package, see 72-00-61 Removal-05.

(1) Drain residual fuel from fuel metering unit by removing lockwire and plug from port (FP3) adjacent to fuel filter on fuel pump. Discard packing.

NOTE: Be prepared to catch fuel in container with a minimum capacity of 5 U.S. gallons (19 liters).

R (2) Use a new packing, lubricated with Aircraft Turbine
R Engine Lubricant P03-001 or Sealing Ring Lubricant
R P06-053, install a plug. Torque the plug to 45 - 55
R lb-in. (5.084 - 6.214 N.m). Lockwire the plug.

(3) Remove lockwire from compressor stator cylinder hydraulic manifold assembly (CP01) and disconnect manifold from fuel metering unit adapter, from stator vane actuator manifold tee, and from fuel bypass valve adapter. Remove manifold from engine.

R (4) Disconnect W4P2 and W5P1 harness connectors from fuel metering unit. Install protective closures.

(5) Remove lockwire and disconnect valve supply tube assembly (FM09) from adapter on fuel metering unit and adapter on fuel flowmeter.

(6) Remove bolts, nut, and clamps securing flow divider valve supply tube assembly to HPC case bracket and airframe cooler oil outlet tube. Remove tube from engine. Discard retainers and packings.

(7) Remove nuts and washers securing fuel metering unit to fuel pump. Remove fuel metering unit from pump.

(8) Remove the transfer tubes from the fuel pump as follows:

  (a) Remove and discard the packings from the fuel pump transfer tubes.

  (b) Remove the retainers that hold the transfer tubes in the fuel pump.

  (c) Remove the transfer tubes from the fuel pump and remove and discard the packings from the inner grooves of the transfer tubes.

(9) Install protective closures.

(10) If new fuel metering unit is to be installed comply with the following.

  (a) Remove threaded adapter from port on inboard side of fuel metering unit and discard packing.

  (b) Remove bolts and bracket securing adapter to outboard fuel supply port on fuel metering unit and remove adapter. Discard packing.

  NOTE: For additional information concerning detailed maintenance of this component, see Fuel Metering Unit Component Maintenance Manual, 73−21−38 (Hamilton Standard Division).

C. Postrequisites

(1) If fuel metering unit will not be installed on engine within 24 hours, it must be preserved. See Fuel Metering Unit Component Maintenance Manual, 73−21−38 (Hamilton Standard Division).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-07

Task 72-00-61-050-004:

1. Remove Fuel Pump From Fuel Metering Unit (On Bench)
   - A. Prerequisites
     - (1) Remove fuel pump and fuel metering unit package per 72-00-61, Removal-05 (Task 72-00-61-050-003).
   - B. Equipment And Materials Required - None
   - C. Procedure

     See Figure 301.
     - (1) Remove nuts and washers securing fuel pump to fuel metering unit. Separate fuel pump from fuel metering unit. Discard packings.

       NOTE: For additional information concerning detailed maintenance of these components see Fuel Metering Unit Component Maintenance Manual, 73-21-38, (Hamilton Standard Division) and Fuel Pump Component Maintenance Manual 73-11-04, (TRW).

     - (2) If new fuel pump is to be replaced comply with the following.
       - (a) Remove bolts and washers securing fuel pump filter differential pressure switch located on upper right front of fuel filter. Remove switch and bracket and discard packings.
       - (b) (Pre SB PW4ENG 73-156 and SB PW4ENG 73-161) Remove the fuel temperature thermocouple probe from the fuel pump.
         - 1 Remove lockwire and fuel temperature thermocouple probe from port on upper right side of fuel filter. Discard packing.
         - 2 Remove lockwire and plug from port adjacent to fuel temperature port on fuel pump filter. Discard packing
       - (c) (Post SB PW4ENG 73-156 and SB PW4ENG 73-161) Remove the fuel temperature thermocouple probe from the fuel pump.
         - 1 Remove the lockwire and the two (2) bolts (301/8) that hold the fuel temperature thermocouple probe (301/1) to the bracket assembly (301/3 and 301/5). Remove the probe. Discard the packing (301/4).
         - 2 Remove the two (2) screws (301/2) that hold bracket (301/3) to bracket (301/5).
         - 3 Remove lockwire and bolt (301/7) from plug (301/9) that holds bracket (301/5) to the bushing (301/6) in the fuel pump.
         - 4 Remove the bushing (301/6) and bracket (301/5) from the fuel pump.

Fuel Pump And Fuel Metering Unit
Figure 301 (Sheet 4)
(Task 72−00−61−050−004)

5 Remove the lockwire and plug (301/9) from the fuel pump. Discard the packing (301/10).

(3) If new fuel metering unit is to be installed comply with the following.

(a) Remove threaded adapter from port on inboard side of fuel metering unit and discard packing.

(b) Remove bolts and bracket securing adapter to outboard fuel supply port on fuel metering unit and remove adapter. Discard packing.

(4) Install protective closures to fuel pump and fuel metering unit.

D. Postrequisites

CAUTION: FUEL METERING UNITS WHICH WILL NOT BE INSTALLED ON ENGINES WITHIN 24 HOURS AFTER REMOVAL MUST BE PRESERVED TO PREVENT INTERNAL CORROSION.

NOTE: For Preservation of the fuel metering unit, see the Fuel Metering Unit Component Maintenance Manual, 73−21−38 or 73−21−64 (Hamilton Standard Division).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-08

Task 72-00-61-050-005:

1. Remove Fuel Bypass Valve

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P06-002	Lubricant

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing (TRW)	1	PN M25988/1-906		

Lockwire, MS20995C32 (TRW) or AS3214-02

B. Procedure

See Figure 301.

(1) Drain residual fuel from fuel pump by removing lockwire and plug from base of pump forward and opposite side of fuel filter (gear discharge port FP3). Discard packing.

NOTE: Be prepared to catch fuel in container with a minimum capacity of 5 U.S. gallons (19 liters).

(2) Using new packing lubricated with Lubricant (P06-002), reinstall plug. Torque plug to 45 - 55 lb-in. (5.084 - 6.214 N.m) and secure with lockwire.

(3) Remove lockwire and disconnect compressor stator cylinder manifold assembly (CP01) from adapter on fuel bypass valve, fuel metering unit, and manifold. Remove manifold from engine.

(4) Remove three bolts securing oil cooler inlet fuel tube assembly to top of fuel bypass valve.

(5) Remove four bolts securing fuel bypass valve to fuel pump and remove valve from pump. Discard packings.

(6) Remove packing from flange of oil cooler inlet fuel tube assembly.

(7) If fuel bypass valve is to be replaced, comply with the following:

(a) Remove adapter from pressure port on fuel bypass valve and discard packing.

Task 72-00-61-050-006:

1. Remove EEC Alternator Stator (Pre SB PW4ENG 72-375)

A. Equipment And Materials Necessary

Special Tools:
PWA 85749 Adapter, Torque

B. Procedure

See Figure 301.

(1) Using PWA 85749 Torque Adapter, disconnect W3P1 and W5P6 harness connectors from EEC alternator stator cables at bracket on lower left side of gearbox.

(2) Remove bolts (301/4) and (301/5) and plate (301/4) securing EEC stator cables to bracket.

(3) Remove clamp and bolt (301/1) securing cable to bracket below alternator. Remove cables from spring clips (301/2) and (301/3).

(4) Remove the alternator stator as follows.

(a) (Pre SB PW4ENG 75-59) Remove the three bolts and washer (301/9) securing the alternator stator (301/8) and heat shield (301/7) to gearbox.

(b) (Post SB PW4ENG 75-59) Remove the three bolts securing the stator (301/8) to gearbox.

(5) Remove stator and if equipped a heat shield from the gearbox

(6) Discard packing (301/6).

(7) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component see EEC Alternator Component Maintenance Manual, 73-21-55 (Bendix).

NOTE: See Removal-10 Task 72-00-61-050-007 for removal of EEC alternator rotor, if required.

Task 72-00-61-050-006-A:

2. Remove EEC Alternator Stator (Post SB PW4ENG 72-375)

A. Equipment And Materials Necessary

Special Tools:
PWA 85749 Adapter, Torque

B. Procedure
See Figures 302, Figure 303 and Figure 304.

(1) (Post SB PW4ENG 72-491) Remove the deoiler idler bearing pressure line (LP35) as follows.

(a) Remove the spray shield from the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15).

(b) Remove the clamps that attach the line to the overboard breather pad bracket and the oil tank mount flange bracket.

(c) Loosen the line nuts at the tee fitting and the deoiler (idler) spur gear assembly in the gearbox.

(d) Carefully remove the line and install the protective closures.

(2) Remove the deoiler outlet tube assembly (LB05) as follows.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES
R WHICH CONTAIN A FLEX DESIGN SEGMENT.
R REMOVE AND INSTALL A TUBE WITH A FLEX
R SEGMENT WITH THE SAME PRECAUTION USED
R FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF THE
R TUBE OR AN ATTACHED COMPONENT. IF A FLEX
R SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN
R THE INNER POLYTETRAFLUOROETHYLENE (PTFE)
R TUBE AND LEAKS OR TUBE RUPTURE CAN BE
R THE RESULT.

(a) Remove clamp bolt that holds the main filter oil tube (LP01) to the deoiler outlet tube flange bracket.

(b) Remove the three bolts that hold the deoiler outlet tube to the gearbox at the overboard breather pad.

(c) Remove the clamps that attach the tube to the bracket at Flanges M and N.

(d) Carefully remove the tube and install the protective closures.

(3) Using PWA 85749 Torque Adapter, disconnect W3P1 and W5P6 harness connectors from EEC alternator stator cables at bracket on lower left side of gearbox.

(4) Remove two bolts securing stator cable connectors, retaining plate, to bracket. Remove retaining plate.

(5) Remove both cable connectors from bracket.

(6) Remove cables from spring clips at brackets on rear face of gearbox.

(7) Remove three bolts that attach the alternator stator to the gearbox.

(8) Carefully remove the stator from the gearbox.

(9) Discard the packing.

(10) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component see EEC Alternator Component Maintenance Manual, 73-21-80 (Airsearch, Allied-Signal).

NOTE: See Removal-10 (Task 72-00-61-050-007-A) for removal of EEC Alternator Rotor (Post SB PW4ENG 72-375), if required.

EEC Alternator (N2 Transducer) Stator
Figure 304
(Task 72−00−61−050−006−A)

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-10

Task 72-00-61-050-007:

1. Remove EEC Alternator Rotor (Pre SB PW4ENG 72-375)
   A. Prerequisites
      (1) Remove EEC alternator stator (Pre SB PW4ENG 72-375). See Removal-09 (Task 72-00-61-050-006).
   B. Equipment And Materials Required

      Special Tools:
      PWA 85238 Wrench (Optional to PWA 86603)
      PWA 86603 Adapter
      PWA 85931 Puller

   C. Procedure
      See Figures 301 and 302.
      (1) Using PWA 85238 Wrench or PWA 86603 Adapter, loosen the rotor retaining nut as follows:
         (a) Loosen both jamnuts (302/3) and retract wrench detail (302/4) from body of wrench.
         (b) Insert handle (302/6) lug end facing outward, over mating lug of wrench detail (302/4).
         (c) Align boltholes and position wrench body (302/2) over EEC gearshaft and onto gearshaft housing (302/1) pad.
         (d) Engage lugs of wrench detail with mating slots in gearshaft. Secure body (302/2) with three detail screws (302/5).
         (e) Seat wrench detail (302/4) firmly on gearshaft and secure with jamnuts (302/3).
         (f) Engage lugs of handle (302/6) with mating lugs in nut (302/7). Rotate handle to loosen nut.

            NOTE: This must be done in several steps because handle movement is restricted and handle must be removed from nut and repositioned.

         (g) Remove cap screws securing wrench to gearbox and remove wrench.
      (2) Remove locknut (302/7) securing EEC alternator rotor to gearshaft.
      (3) Remove the rotor lock.
      (4) With PWA 85931 Puller, remove the rotor from gearshaft.
      (5) Install protective closures.

         NOTE: For additional information concerning detailed maintenance of this component see EEC Alternator Component Maintenance Manual, 73-21-55 (Bendix).

Rotor Retaining Nut Removal
Figure 302
(Task 72-00-61-050-007)

ENGINE GENERAL – MAIN GEARBOX – REMOVAL–10

Task 72–00–61–050–007–A:

2. Remove EEC Alternator Rotor (Post SB PW4ENG 72–375)

A. Prerequisites

  (1) Remove EEC alternator stator (Post SB PW4ENG 72–375). See Removal–09 (Task 72–00–61–050–006–A).

B. Equipment And Materials Required

Special Tools:
PWA 86603 Adapter
PWA 86551 Puller

C. Procedure

See Figures 303 and 304.

  (1) Loosen the rotor retaining nut with PWA 86603 Adapter as follows.
    (a) Loosen both jamnuts (303/3). While you hold the body (303/2), loosen the wrench detail (303/4).
    (b) Install the handle (303/6),lug end facing outward, over the mating lug of wrench detail (303/4).
    (c) Align boltholes and position body (303/2) over EEC gearshaft (303/8) and onto the gearshaft housing (303/1) pad.
    (d) Engage lugs of wrench detail with mating slots in gearshaft. Attach the body (303/2) with three detail screws (303/5).
    (e) Seat the wrench detail (303/4) firmly on the gearshaft and tighten the jamnuts (303/3).
    (f) Engage the lugs of handle (303/6) with the mating lugs in the nut (303/7). Turn the handle to loosen the nut using a standard 1/2 inch drive.

      NOTE: This must be done in several steps as the handle movement is limited. The handle must be removed and positioned again to the nut.

    (g) Remove the screws (303/5) that attach the adapter to the gearbox and remove adapter.
  (2) Remove the nut (303/7) that attaches EEC alternator rotor to the gearshaft.
  (3) Remove the rotor (304/5) from the gearshaft (304/6) with a PWA 86551 Puller as follows.
    (a) Retract the hex bolt (304/2) on the rotor puller. Loosen the two socket head screws (304/3) and install the jaws (304/1) in the puller groove on the rotor (304/5).
    (b) Install the ring (304/4) around the jaws (304/1) and against the shoulder of the jaws.
    (c) Tighten the two socket heads screws (304/3)

(d) Tighten the hex head bolt (304/2) until the rotor is removed from the gearshaft (304/6) .

NOTE: The puller and rotor can turn when the hex bolt (304/2) is tightened. To prevent the rotor from turning, you can install a rod or punch into one of the holes in the puller jaws and hold while the the hex bolt is tightened.

(e) Loosen the hex bolt (304/2) and the two socket head screws (304/3). Remove the ring (304/4) from the puller and remove the puller from the rotor.

(4) Install protective closures.

NOTE: For additional information concerning detailed maintenance of this component see EEC Alternator Component Maintenance Manual, 73−21−80 (Airsearch, Allied−Signal).

Task 72-00-61-030-002:

1. Remove Deoiler Drive Oil Seal Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 85204 Puller (Optional to PWA 88110)
      PWA 88110 Puller

   B. Procedure
      See Figure 301.

      (1) Remove retaining ring securing deoiler oil seal assembly in ejector port on rear of gearbox.
      (2) Install either PWA 88110 or PWA 85204 Puller in oil seal assembly and secure.
         (a) Engage puller jaws in groove of seal assembly.
         (b) Slide down puller ring until jaws are secured in groove.
      (3) Remove oil seal assembly using slide hammer action of puller. Remove puller. Discard packing.
      (4) Install protective closure.

Task 72−00−61−030−003:

1. Remove Starter Drive Oil Seal Assembly

A. Equipment And Materials Required

Special Tools:
PWA 85204 Puller (Optional to PWA 88110)
PWA 88110 Puller

B. Procedure

See Figure 301.

- (1) Remove retaining ring securing starter drive oil seal assembly.
- (2) Install either PWA 88110 or PWA 85204 Puller in seal assembly.
  - (a) Engage puller jaws in groove of seal assembly.
  - (b) Slide down puller ring until jaws are secured in groove.
- (3) Remove oil seal assembly using slide hammer action of puller to overcome resistance of preformed packing. Remove puller. Discard packing.
- (4) Install protective closure.

Task 72-00-61-030-005:

1. Remove EEC Alternator Drive Oil Seal Assembly
    - A. Prerequisites
        - (1) Remove EEC alternator stator per 72-00-61, Removal-09 (Task 72-00-61-050-006).
        - (2) Remove EEC alternator rotor per 72-00-61, Removal-10 (Task 72-00-61-050-007).
    - B. Equipment And Materials Required

      Special Tools:

      PWA 85723 Puller

    - C. Procedure
      See Figures 301 and 302.
        - (1) Remove retaining ring securing EEC alternator drive oil seal assembly.
        - (2) Install PWA 85723 Puller to seal assembly and secure.
            - (a) Engage puller jaws in groove of seal assembly.
            - (b) Tighten down puller ring until jaws are secured in groove.
        - (3) Remove oil seal assembly using slide hammer action of puller to overcome resistance of preformed packing. Remove puller. Discard packing.
        - (4) If there is the possibility of damage to seal seat, remove sleeve spacer, discard EEC gearshaft packing, and remove seal seat. Examine seal seat for damage.
        - (5) Install protective closure.

ENGINE GENERAL – MAIN GEARBOX – REMOVAL-16

Task 72-00-61-030-007:

1. Remove Rear Hydraulic Pump Drive Oil Seal Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 85204 Puller (Optional to PWA 88110)
      PWA 88110 Puller

   B. Procedure
      See Figure 301.
      (1) Remove retaining ring securing hydraulic pump drive oil seal assembly.
      (2) Install either PWA 88110 or PWA 85204 Puller to oil seal assembly and secure.
         (a) Engage puller jaws in groove of seal assembly.
         (b) Slide down puller ring until jaws are secured in groove.
      (3) Remove oil seal assembly using slide hammer action of puller to overcome resistance of preformed packing. Remove puller. Discard packing.
      (4) Install protective closure.

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−17

Task 72−00−61−030−008:

1. Remove Front Hydraulic Pump Drive Oil Seal Assembly
   A. Equipment And Materials Required

      Special Tools:
      PWA 85204 Puller (Optional to PWA 88110)
      PWA 88110 Puller

   B. Procedure
      See Figure 301.
      (1) Remove retaining ring securing hydraulic pump drive oil seal assembly.
      (2) Install either PWA 88110 or PWA 85204 Puller to oil seal assembly and secure.
         (a) Engage puller jaws in groove of seal assembly.
         (b) Slide down puller ring until jaws are secured in groove.
      (3) Remove oil seal assembly using slide hammer action of puller to overcome resistance of preformed packing. Remove puller. Discard packing.
      (4) Install protective closure.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-18

Task 72-00-61-030-009:

1. Remove Starter Drive Coupling
   - A. Equipment And Materials Required

     Special Tools:
     PWA 26377 Holder
     PWA 85502 Puller

   - B. Procedure
     See Figure 301.
     - (1) Install splined drive of PWA 26377 Holder into starter drive coupling and secure bar with two bolts to starter drive mount pad.
     - (2) Using standard wrench, reach into holder and remove nut which retains starter drive coupling.
     - (3) Remove holder from gearbox.
     - (4) Using PWA 85502 Puller in puller hole in rear ID of coupling (behind splines), remove coupling with steady pull on handle of puller tool. Remove coupling from tool and remove flat washer from coupling ID.

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−19

Task 72−00−61−030−010:

1. Remove Deoiler

This Procedure Has Been Deleted

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-61-040-001:

1. Remove Main Oil Filter Housing

A. Equipment And Materials Necessary − None

B. Procedure
See Figure 301 through Figure 302.

WARNING: PRESSURE CAN SUDDENLY FORCE OUT HOT OIL ONTO YOU. HOT OIL CAN CAUSE BURNS.

WARNING: BEFORE YOU DRAIN THE OIL FROM THE MAIN OIL FILTER HOUSING, PERMIT PRESSURE TO BLEED FROM THE OIL SYSTEM. WAIT A MINIMUM OF FIVE MINUTES AFTER THE ENGINE STOPS.

(1) Drain the oil from the main oil filter housing assembly (called oil filter housing) (301/1) as follows. See Figure 301 (Sheets 1 and 6).

(a) Prepare to catch the oil in a 5 gallon (19 l) container.

(b) Remove the plug from the cover assembly (301/2).

1 Remove the lockwire from the plug.

2 Hold the insert with a wrench while you remove the plug. Remove the plug.

3 Discard the packing.

(2) Disconnect the air/oil cooler inlet tube assembly (LP02) as follows. See Figure 301 (Sheet 1).

(a) Remove the three bolts that attach the assembly to the "oil-out" hole on top of the oil filter housing.

(b) Discard the packing.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE

R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(3) Remove the main filter oil tube assembly (LP01) as follows. See Figure 301 (Sheet 2) and Figure 301 (Sheet 3).

- (a) Remove the three bolts that attach the assembly to the "oil−in" hole on the front of the oil filter housing.
- (b) Remove the bolts and nuts that attach the tube clamps to the engine.
- (c) Remove the assembly.
- (d) Discard the packings.

(4) Remove the oil cooler bypass valve drain tube assembly (LP20) as follows. See Figure 301 (Sheet 4).

- (a) Remove the bolts that attach the tube to the "servo" hole on the oil filter housing.
- (b) Disconnect the upper end of the tube at the fuel/oil cooler bypass valve.
- (c) Remove the tube.
- (d) Discard the packings and retainer.

(5) Disconnect the oil trim pressure tube assembly (LP32) as follows. See Figure 301 (Sheet 4).

- (a) Remove the lockwire and disconnect the tube nut above the fuel/oil cooler.
- (b) Remove the clamp bolt that attaches the tube to the bracket in back of the fuel/oil cooler.
- (c) Remove the bolts that attach the assembly to the "trim" hole on the oil filter housing.
- (d) Disconnect the assembly from the oil filter housing.
- (e) Discard the packing.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-20

(6) Disconnect the W3 and W5 wiring harnesses as follows. See Figure 301 (Sheet 4).

   (a) Remove the bolt and nut that attach the wiring harness clamp to the bracket on the oil filter housing.

(7) Remove the oil filter housing (301/1) as follows. See Figure 301 (Sheet 1).

   (a) Remove the bolts and washers that attach the oil filter housing to the front of the gearbox.

   (b) Remove the oil filter housing.

(8) Remove the transfer tubes and, if applicable, the antisiphon tube assembly as follows. See Figure 301 (Sheet 5).

   (a) Remove the transfer tubes and, if applicable, the anti-siphon tube assembly from the holes in the front of the gearbox. Oil filter housings that are (Pre SB PW4ENG 79-43) have three transfer tubes. Oil filter housings that are (Post SB PW4ENG 79-43) have two transfer tubes and an anti-siphon tube assembly.

   (b) Discard the packings.

(9) (Pre SB PW4ENG 72-524) If applicable, remove the details from the MOFH as follows. See Figure 301 (Sheet 6) and Figure 301 (Sheet 7).

   (a) Remove lockwire and pressure relief valve (filter element) (301/19) from port in main oil filter housing (301/3) located just above pressure (regulator) relief valve pad (301/16). Discard packings (301/17 and 301/18).

   (b) Remove inserts (301/1) from ports in face of main oil filter housing. Discard packings (301/2).

   (c) Remove lockwire, plug (301/12) and insert (301/10) from bottom port in main oil strainer cover (301/15). Discard packings (301/9 and 301/11).

(d) Remove four bolts (301/13) and washers (301/14) securing main oil strainer cover (301/15) to main oil filter housing (301/3). Remove cover and filter element (301/4) from housing. Remove filter element. Discard packing (301/8).

(e) Remove spring (301/5) from cover. Remove screw (301/6) securing key washer (301/7) to cover. Remove key washer and discard.

(f) Remove the oil system pressure relief valve (301/16) as follows.

1 Remove the lockwire from the valve.

2 Remove the bolts that attach the bracket and valve to the MOFH.

3 Remove the bracket and valve.

4 Discard the packings.

(10) (Post PW4ENG 72−524 and Pre SB PW4ENG 79−79) If applicable, remove the details from the MOFH as follows. See Figure 301 (Sheet 8) and Figure 301 (Sheet 9).

(a) Remove lockwire and pressure relief valve (filter element) (301/19) from port in main oil filter housing (301/3) located just above pressure (regulator) relief valve pad (301/16). Discard packings (301/17 and 301/18).

(b) Remove inserts (301/1) from ports in face of main oil filter housing. Discard packings (301/2).

(c) Remove lockwire, plug (301/12), and insert (301/10) from bottom port in main oil strainer cover (301/15). Discard packings (301/9 and 301/11).

(d) Remove lockwire, and if necessary, the four nuts (301/29) or (301/30) and the washers (301/14) that secure the main oil strainer cover (301/15) to main oil filter housing (301/3). Remove cover and filter element (301/4) from housing. Remove filter element. Discard packing (301/8).

(e) Remove spring (301/5) from cover. Remove screw (301/6) securing key washer (301/7) to cover. Remove key washer and discard.

(f) Remove the oil system pressure relief valve (301/16) as follows.

1 Remove the lockwire from the valve.

2 Remove the bolts that attach the bracket and valve to the MOFH.

3 Remove the bracket and valve.

4 Discard the packings.

(g) Make a check of the studs installed in the main oil filter housing. If the studs are satisfactory, the cover can be installed again, if the studs are not serviceable, repair the housing by Chapter/Section 72-61-60 in the PW4000 Series CIR, PN 51A357 Manual. See Figure 302.

(11) (Post SB PW4ENG 72-524 and SB PW4ENG 79-79) If applicable, remove the details from the MOFH as follows. See Figure 301 (Sheet 10) and Figure 301 (Sheet 11).

(a) Remove the lockwire and the pressure relief valve (filter element) (301/19) from the port in the main oil filter housing (301/3) located just above the pressure (regulator) relief valve pad (301/16). Discard the packings (301/17 and 301/18).

(b) Remove the inserts (301/1) from the ports in the face of the main oil filter housing. Discard the packings (301/2).

(c) Remove the lockwire, plug (301/12), and insert (301/10) from the bottom port in the main oil strainer cover (301/21). Discard the packings (301/9 and 301/11).

(d) Remove the lockwire, and if necessary, the four nuts (301/29) or (301/30) and the washers (301/14) that secure the main oil strainer cover (301/21) to the main oil filter housing (301/3). Remove the cover and the filter element (301/4) from the housing. Remove the filter element. Discard the packing (301/8).

(e) Remove the spring (301/5) from the cover (301/21). Remove the two screws (301/22) and the two washers (301/20) securing the spring retainer (301/23) to the cover (301/21).

(f) Remove the oil system pressure relief valve (301/16) as follows.

1 Remove the lockwire from the valve.

2 Remove the bolts that attach the bracket and valve to the MOFH.

3 Remove the bracket and valve.

4 Discard the packings.

(g) Make a check of the studs installed in the main oil filter housing. If the studs are satisfactory, the cover can be installed again, if the studs are not serviceable, repair the housing by Chapter/Section 72-61-60 in the PW4000 Series CIR, PN 51A357 Manual. See Figure 302.

(12) (Post SB PW4ENG 72-525) If applicable, remove the details from the MOFH as follows. See Figure 301 (Sheet 12) and Figure 301 (Sheet 13).

(a) Remove lockwire and plug (301/43) from port in main oil filter housing (301/3) located just above pressure (regulator) relief valve pad (301/16). Discard packings (301/17 and 301/18).

(b) Remove inserts (301/1) from ports in face of main oil filter housing. Discard packings (301/2).

(c) Remove lockwire and plug (301/12), from bottom port in main oil strainer cover (301/42). Discard packing (301/11).

(d) Remove four nuts (301/29) and washers (301/14) securing main oil strainer cover (301/42) to main oil filter housing (301/3). Remove cover and filter element (301/39) from housing. Remove filter element. Discard packing (301/8).

(e) Remove retaining ring (301/40) from pressure relief valve (301/41) and remove pressure relief valve from cover (401/42).

CAUTION: PRESSURE RELIEF VALVE IS SPRING LOADED. EXERCISE CARE WHEN REMOVING.

(f) Remove the oil system pressure relief valve (301/16) as follows.

1 Remove the lockwire from the valve.

2 Remove the bolts that attach the bracket and valve to the MOFH.

3 Remove the bracket and valve.

4 Discard the packings.

(g) Make a check of the studs installed in the main oil filter housing. If the studs are satisfactory, the cover can be installed again, if the studs are not serviceable, repair the housing by Chapter/Section 72−61−60 in the PW4000 Series CIR, PN 51A357 Manual. See Figure 302.

Front Hydraulic Pump Drive Cover, Plug And Bolt Removal
Figure 301
(Task 72−00−61−030−013)

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-24

Task 72-00-61-060-001:

1. Remove The Fuel Pump Filter
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.

     WARNING: DO NOT LET ENGINE FUEL STAY ON YOUR SKIN FOR A LONG TIME. THE FUEL IS POISONOUS AND CAN GO THROUGH YOUR SKIN. PUT A CONTAINER, MINIMUM CAPACITY OF 5 U.S. GALLONS (19 LITERS), IN POSITION AND COLLECT THE DRAINED FUEL.

     - (1) Remove the lockwire and plug from the center of the fuel pump filter cover. Let fuel drain. Discard the packing from the plug.
     - (2) For fuel pumps with the five cover bolts, washers, and no nuts (Pre SB PW4ENG 73-75), remove the filter as follows.
       - (a) Remove the bolts and washers. Monitor the torque necessary to remove (back-out) the bolt from each heli-coil self-locking feature. If the torque is less than 6.5 lb-in. (0.73 N.m), you must replace the heli-coil insert. (See Component Maintenance Manual, 73-11-04 for heli-coil replacement).
       - (b) Remove the cover and fuel filter.

         NOTE: Some covers have machined slots in the split surface of the cover. These slots will help remove the cover.

       - (c) Discard the packing from the cover.
       - (d) Examine the filter, the filter cavity, and the filter cover. Be sure that the filter element gaskets are on the filter element and not stuck in the housing cavity or the cover. Remove the gaskets if necessary.
       - (e) Install the protection covers.

     - (3) For fuel pumps with the four cover nuts, washers, dee-bolts, and the torque-limiting bolt (Post SB PW4ENG 73-75) and (Pre SB PW4ENG 73-104), remove the filter as follows.

       CAUTION: WHEN YOU LOOSEN THE TORQUE-LIMITING BOLT, DO NOT PUT UNWANTED FORCE ON THE BOLT HEAD. KEEP THE WRENCH STRAIGHT AND AT 90 DEGREES TO THE BOLT HEAD AND LOOSEN THE BOLT SLOWLY. BOLT HEAD FAILURE CAN RESULT IF YOU DO NOT USE THESE INSTRUCTIONS.

Fuel Pump Filter
Figure 301
(Task 72−00−61−060−001)

(a) Keep the wrench straight and at 90 degrees to the bolt head and slowly loosen and remove the torque−limiting bolt. Monitor the torque necessary to remove (back−out) the bolt from the heli−coil self−locking feature. If this torque is less than 6.5 lb−in. (0.73 N.m), you must replace the heli−coil insert. (See Component Maintenance Manual, 73−11−04 for heli−coil replacement).
(b) Remove the nuts, washers and dee−bolts.
(c) Remove the cover and fuel filter.

NOTE: Some covers have machined slots in the split surface of the cover. These slots will help remove the cover.

(d) Discard the packing from the cover.
(e) Examine the filter, the filter cavity, and the filter cover. Be sure that the filter element gaskets are on the filter element and not stuck in the housing cavity or the cover. Remove the gaskets if necessary.
(f) Install the protection covers.

(4) For fuel pumps with the five cover nuts, washers, and the four dee−bolts (Post SB PW4ENG 73−105), remove the filter as follows.
(a) Remove the nuts, washers and dee−bolts.
(b) Remove the cover and fuel filter.

NOTE: Covers have machined slots in the split surface of the cover. These slots will help remove the cover.

(c) Discard the packing from the cover.
(d) Examine the filter, the filter cavity, and the filter cover. Be sure that the filter element gaskets are on the filter element and not stuck in the housing cavity or the cover. Remove the gaskets if necessary.
(e) Install the protection covers.

Task 72-00-61-050-009:

1. Remove Fuel Pump Filter Differential Pressure Switch

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 301.

      (1) Disconnect electrical connector. Install protective closures.

      (2) Remove bolts and washers securing switch to fuel pump. Remove bracket. Remove switch and discard packings. Install protective closures.

         NOTE: For additional information concerning detailed maintenance of this component see Fuel Pump Filter Differential Pressure Switch Component Maintenance Manual, 73-11-10 (Custom Component Switches).

Task 72-00-61-050-010:

1. Remove EEC Fuel Temperature Thermocouple Probe
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) (Pre SB PW4ENG 73-84), Remove the EEC fuel temperature thermocouple probe as follows:
       - (a) Disconnect W5P8 harness connector from EEC fuel temperature thermocouple probe located on upper end of fuel pump filter housing.
       - (b) Remove lockwire from probe and remove probe from boss on fuel pump filter housing. Discard packing.

         NOTE: Be prepared to catch fuel in a container with a minimum capacity of 5 U.S. gallons (19 liters).

         For additional information concerning detailed maintenance of this component see EEC Fuel/Oil Temperature Thermocouple Probe Component Maintenance Manual, 73-21-47 (PW Manual PN 50A447).

       - (c) Install protective closure.
     - (2) (Post SB PW4ENG 73-84), Remove the harness connector and the thermocouple probe as follows.
       - (a) Remove the nuts that attach the W5 wiring harness to the studs on the thermocouple.
       - (b) Remove the bolt, clamp, and ground strap that are attached to the bracket on the fuel pump filter housing.
       - (c) Remove the wiring harness terminals from the thermocouple studs.
       - (d) Remove the lockwire from the thermocouple probe nut to the adapter. Remove the thermocouple probe from the housing.

         NOTE: Be prepared to catch fuel in a container with a minimum capacity of 5 U.S. gallons (19 liters).

         For additional information concerning detailed maintenance of this component see EEC Fuel/Oil Temperature Thermocouple Probe Component Maintenance Manual, 73-21-47 (PW Manual PN 50A447).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-27

Task 72-00-61-050-011:

1. Remove EEC Oil Temperature Thermocouple Probe
   A. Equipment And Materials Required - None
   B. Procedure
      See Figure 401.
      (1) (Pre SB PW4ENG 73-84), Remove EEC oil temperature thermocouple probe as follows.
         (a) Disconnect W3P18 harness connector from EEC oil temperature thermocouple probe located on lower, left side of main gearbox front face.
         (b) Remove lockwire from probe and remove probe from boss on gearbox. Discard packing.

            NOTE: Be prepared to catch oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

            For additional information concerning detailed maintenance of this component see EEC Fuel/Oil Temperature Thermocouple Probe Component Maintenance Manual, 73-21-47 (PW Manual PN 50A447).

         (c) Install protective closure.
      (2) (Post SB PW4ENG 73-84), Remove the harness connector and the thermocouple probe as follows.
         (a) Remove the nuts that attach the W3 wiring harness to the studs on the thermocouple.
         (b) Remove the bolt, clamp, and ground strap that are attached to the main gearbox pressure tube (LP12).
         (c) Remove the wiring harness terminals from the thermocouple studs.
         (d) Remove the lockwire from the thermocouple probe nut to the adapter. Remove the thermocouple probe from the housing.

            NOTE: Be prepared to catch oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

            For additional information concerning detailed maintenance of this component see EEC Fuel/Oil Temperature Thermocouple Probe Component Maintenance Manual, 73-21-47 (PW Manual PN 50A447).

         (e) Remove the lockwire from the adapter to the housing. Remove the adapter from the housing and discard packing.

Task 72-00-61-050-012:

1. Remove The Lube Oil Tank Assembly

A. Prerequisites

(1) Remove the (lower left) turbine vane cooling air tube (AP03). Refer to 72-00-52, Removal-07 (Task 72-00-52-050-004).

(2) Remove the magnetic chip detector assembly from the oil tank. Refer to Removal-36 (Task 72-00-61-050-017).

(3) Remove the oil tank sight gage if it is necessary to use the sight gage from this oil tank on another oil tank. Refer to Removal-31 (Task 72-00-61-050-013).

B. Equipment And Materials Necessary

Special Tools:

PWA 88231	Puller, Jackscrew

C. Procedure

(1) Remove the oil tank from the gearbox. See Figure 301.

(a) Remove the bolt (301/2) and engine ground-strap (301/4) from the oil tank. The ground-strap must stay with the engine.

(b) Remove the bolt (301/2) and bracket (301/5) that has the identification plate. The bracket must stay with the gearbox.

(c) Remove the bolt (301/2) that holds the heat shield (301/1) and, if applicable, bracket (Pre SB PW4ENG 79-48) (301/3) and bracket (Post SB PW4ENG 72-491) (301/7).

CAUTION: TO PREVENT DAMAGE TO THE GEARBOX HOUSING, MAKE SURE ALL THE OIL TANK TO GEARBOX ATTACHMENT BOLTS ARE REMOVED BEFORE INSTALLING PWA 88231 PULLER.

(d) Remove the remaining bolts that attach the oil tank to the gearbox.

(e) Use PWA 88231 Puller to carefully remove the oil tank from the gearbox.

(2) Remove packings (302/1), (302/2), (302/3), and (302/4). Discard the packings. See Figure 302.

(3) If it is necessary to use the heat shield from this oil tank on another oil tank, remove the heat shield. See Figure 301.

  (a) Remove the clamp (301/6).

  (b) (Pre SB PW4ENG 72−74) Remove the six (6) bolts (301/8) and nuts (301/11) that attach the cover (301/10) to the flange of the hole at the top of the lube oil tank.

  (c) (Post SB PW4ENG 72−74) Remove the six (6) bolts (301/8) and nuts (301/11) that attach the cover (301/10) and the oil tank heat shield bracket (301/12) to the flange of the hole at the top of the lube oil tank.

  (d) Remove the heat shield (301/1) and, if applicable, bracket (301/3).

(4) Remove the oil tank cap and related parts from this oil tank if it is necessary to use those parts on another oil tank. This procedure is for an oil tank that either has no remote filler or is post SB PW4ENG 79−47. See Figure 303.

  (a) Remove the oil tank cap (303/1):

    1 Lift the handle. Turn the cap counterclockwise. Remove the cap.

    2 Remove the lockwire and bolt (303/4) that hold the oil tank cap lanyard (303/3).

    3 Discard the packing (303/2).

  (b) Remove the filler neck valve (303/5):

    1 Remove the lockwire and remaining bolts (303/4).

    2 Remove the filler neck valve.

    3 Discard the packing (303/6).

4 Examine the packing (303/8) under the valve. If the packing is cut or deteriorated, discard it.

(c) Remove the oil tank sump (303/7).

(5) Remove the oil tank cap and related parts from this oil tank if it is necessary to use those parts on another oil tank. This procedure is for an oil tank that has a remote filler and is pre SB PW4ENG 79−47. See Figure 304.

(a) Remove the oil tank cap (304/1):

1 Lift the handle. Turn the cap counterclockwise. Remove the cap.

2 Remove the bolt (304/4) and nut (304/16) that hold the oil tank cap lanyard (304/5).

3 Discard the packing (304/2).

(b) Remove the filler neck valve (304/3):

1 Remove the lockwire and the remaining bolts (304/4 and 304/7) and nuts (304/16).

2 Remove the filler neck valve.

3 Discard the packing (304/6).

4 Examine the packing (304/17) under the valve. If the packing is cut or deteriorated, discard it.

(c) Remove the oil tank sump (304/8).

(d) Remove the connector (304/9) (remote filler):

1 Remove the lockwire and bolts (304/12).

2 Remove the connector.

3 Discard the packing (304/13).

4 If applicable, remove the plugs (304/11 and 304/15) and packings (304/10 and 304/14). Discard the packings.

(6) To protect the oil tank holes, install covers.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-29

Task 72-00-61-030-014:

1. Remove Pressure (Regulator) Relief Valve
    A. Equipment And Materials Required - None
    B. Procedure
    See Figure 301.

WARNING: BE VERY CAREFUL WHEN YOU REMOVE THE RELIEF VALVE PLUG. THE PLUG IS SPRING LOADED.

(1) Remove the lockwire from the relief valve plug (301/1).
(2) Remove the relief valve plug (301/1) from the housing (301/6).

NOTE: Catch the oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

(3) Discard the packing (301/2).
(4) Remove the spring (301/3) and the pressure relief valve (301/4) from the housing (301/6).
(5) Discard the packing (301/5).
(6) If necessary, remove the pressure relief valve housing (301/6) from the main oil filter housing as follows.
    (a) Remove the clamp bolt and nut that attach the harness to the bracket (301/10).
    (b) Remove the three bolts (301/9) that attach the housing (301/6) to the main oil filter housing.
    (c) Remove the bracket (301/10).
    (d) Remove the relief valve housing (301/6).
    (e) Discard the packings (301/7) and (301/8).
    (f) Install the protection covers.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-30

Task 72-00-61-030-015:

1. Remove Pressure Relief Valve (Filter Element) (Pre SB PW4ENG 72-525)
   A. Equipment And Materials Required - None
   B. Procedure
   See Figure 301.

NOTE: A Dual Element Oil Filter is introduced by SB PW4ENG 72-525 which also replaces the pressure relief valve in the main oil filter housing with a plug. For Post SB PW4ENG 72-525 removal of the pressure relief valve and the replacement plug, see 72-00-61, Removal-20 or 72-61-00, Disassembly-04.

WARNING: A MINIMUM OF FIVE MINUTES SHOULD ELAPSE AFTER ENGINE SHUTDOWN BEFORE REMOVING PRESSURE RELIEF VALVE TO ALLOW TANK PRESSURE TO BLEED OFF.

USE CARE WHEN REMOVING PRESSURE RELIEF VALVE ON A RECENTLY RUN ENGINE. HOT OIL UNDER PRESSURE COULD BE RELEASED TO CASUE SEVERE BURNS ON CONTACT WITH EYES OR SKIN.

(1) Remove lockwire and remove pressure relief valve from main oil filter housing. Discard packings.

Task 72-00-61-050-013:

1. Remove The Oil Tank Sight Gage
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Remove the lockwire and bolts (301/1).
     - (2) Remove the oil tank sight gage (301/2).
     - (3) Remove and discard the packing (301/3).
     - (4) Protect the oil tank hole with a cover.

Task 72-00-61-050-014:

1. Remove Lubrication And Scavenge Oil Pump

A. Prerequisites

(1) Remove the magnetic plug assemblies in the oil tank and main gearbox. Refer to Removal-36 (Task 72-00-61-050-017).

B. Equipment And Materials Necessary

Special Tools:

PWA 86630	Jackscrew Puller (2 are necessary) - Optional to PWA 88774 Jackscrew Puller
PWA 88774	Jackscrew Puller (2 are necessary) - Optional to PWA 86630 Jackscrew Puller

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-11-00/2/1
Lockwire, AS3214-02		

C. Procedure
See Figure 301 and Figure 302.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH
R CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND
R INSTALL A TUBE WITH A FLEX SEGMENT WITH THE
R SAME PRECAUTION USED FOR A TUBE WITHOUT A
R FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A
R TUBE TO HELP WITH THE INSTALLATION OR REMOVAL
R OF THE TUBE OR AN ATTACHED COMPONENT. IF A
R FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE
R A KINK IN THE EXTERNAL WIRE BRAID AND IN THE
R INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND
R LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(1) (Pre SB PW4ENG 79-75) Remove bolts securing bracket and flange of main filter oil tube assembly (LP01) to top rear port on oil pump. Loosen bolts securing clamps to

bracket and swing bracket clear of pump. See Figure 301.

R CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(2) (Post SB PW4ENG 79-75) Loosen the main oil filter hose, tube assembly (LP01) and the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86) as follows. See Figure 302.

(a) Remove the bolts that hold the tube to the top of the fluid pressure dampener or adapter.

(b) Remove bolt, nut and clamp securing tube to diffuser case bracket at approximately 7 o'clock position.

(c) Remove bolts, nuts and clamps securing tube to gearbox brackets.

(d) If applicable, remove the bolts that hold the fluid pressure dampener or adapter to the top of the main oil pump.

(e) If applicable, remove the bolts and nuts that hold the loop clamp bracket to the fluid pressure dampener or adapter. Remove the bracket.

(f) If applicable, remove the dampener or adapter from the pump.

(g) Discard the packings from the hose, tube assembly and the dampener or adapter, as applicable.

(3) Remove bolts securing flanges of the following scavenge tubes starting at right rear of pump and working forward.

(a) No. 3 bearing oil scavenge manifold assembly (LR04).

NOTE: The No. 3 bearing oil scavenge manifold assembly contains a strainer element (Post SB PW4ENG 79−58) at the scavenge pump side of the manifold.

(b) No. 4 bearing oil scavenge tube assembly (LR05).

(c) Angle gearbox oil scavenge tube assembly (LR01).

(d) Main bearing oil scavenge tube assembly (LR03).

(4) Loosen clamps on tubes as necessary to allow flexibility for tube flanges to be disengaged from pump.

(5) Loosen and remove the bolts and washers that attach the oil pump to the pad on the rear face of the gearbox. Disengage the tubes from the oil pump. Install two PWA 88774 Jackscrew Pullers or PWA 86630 Jackscrew Pullers to the holes in the oil pump mount flange that have threads. Turn the jackscrews equally to disengage the pump from the gearbox. Remove the pump from the gearbox. Remove the two transfer tubes and discard the packings. Remove and discard the packings on the pump.

NOTE: If you cannot find the two threaded bolt holes on the oil pump flange, you cannot use the two PWA 86630 Jackscrew Pullers or PWA 88774 Jackscrew Pullers to remove the oil pump. To remove oil pumps without threaded bolt holes, carefully pull on the pump to remove it from the gearbox.

NOTE: To get the the two threaded bolt holes in the oil pump flange, see Sundstrand SB 5008437−79−4.

(6) Remove and discard packings from the five tubes previously disconnected from pump.

(7) Install the protection covers.

NOTE: For additional information concerning detailed maintenance of this component see Lubrication And Scavenge Oil Pump Component Maintenance Manual, 79−21−10 (Sundstrand Aviation).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-33

Task 72-00-61-020-003:

1. Remove Main Gearbox

NOTE: See Figure 301 for part/assembly removal sequence.

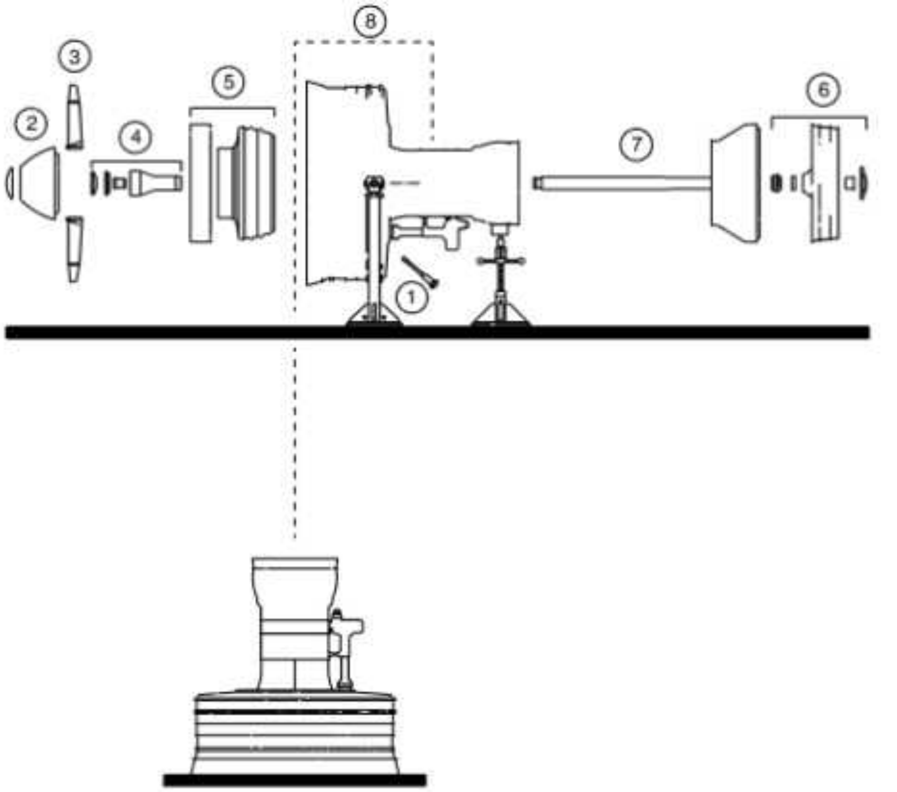
A. Prerequisites
  (1) Remove low pressure compressor per 72-00-31, Removal-01 (Task 72-00-31-020-003).
  (2) Remove turbine exhaust case per 72-00-54, Removal-01 (Task 72-00-54-020-001).
  (3) Remove LPT with shaft per 72-00-53, Removal-01 (Task 72-00-53-020-001).
  (4) Trunnion fan cases through HPT from horizontal to front end down.
  (5) Remove fuel pump and fuel metering unit (package) per Removal-05 (Task 72-00-61-050-003).
  (6) Remove ignition exciters per Removal-03 (Task 72-00-61-050-001) and Removal-04 (Task 72-00-61-050-002).
  (7) Remove the exciter-to-igniter plug cable (upper plug-upper box) per 72-00-41, Removal-04 (Task 72-00-41-050-001).
  (8) Remove the exciter-to-igniter plug cable (lower plug-lower box) per 72-00-41, Removal-05 (Task 72-00-41-050-002).
  (9) Disconnect the W3 and W5 EEC wiring harnesses from the main gearbox per 72-00-61, Removal-34 (Task 72-00-61-050-015).
  (10) Remove the external plumbing per Removal-02 (Task 72-00-61-020-003).

B. Equipment And Materials Required

Special Tools:
PWA 85123 Fixture, Handling (Optional to PWA 86056 Fixture)
PWA 85241 Arm, Lifting
PWA 86056 Fixture, Handling

C. Procedure
See Figures 302 through 304.
  (1) Using hoist and nylon sling, position PWA 86056 or PWA 85123 Handling Fixture (302/3) against main gearbox. Secure to main gearbox at four ground handling points using detail posts and screws (302/4). Remove sling.
  (2) Secure PWA 85241 Lifting Arm (302/1) to handling fixture using four detail screws (302/2). There are three possible attachment positions, depending on the components installed on gearbox.

ENGINE GENERAL − MAIN GEARBOX − REMOVAL−33



1. REMOVE N1 SPEED SENSOR
2. REMOVE COMPRESSOR INLET CONE
3. REMOVE FIRST STAGE (FAN) BLADES
4. REMOVE FAN/LPT COUPLING ASSEMBLY
5. REMOVE LPC GROUP
6. REMOVE TURBINE EXHAUST CASE GROUP
7. REMOVE LPT GROUP WITH SHAFT
8. TRUNNION FAN CASES THROUGH HPT FROM HORIZONTAL TO FRONT END DOWN

(Task 72-00-61-020-003)

CAUTION: USE OF SCREWDRIVER, OR SIMILAR TOOL, TO SEPARATE DRIVESHAFT HOUSING FROM GEARBOX MAY RESULT IN DAMAGE TO SEALING SURFACES.

(3) Remove bolts (302/5) securing gearbox driveshaft (front) housing brackets (303/1) and (301/2) to high pressure compressor.
(4) Remove bolts (303/16), nuts (303/15), and washers (303/11) and (303/16) securing gearbox driveshaft (front) housing (303/3) to angle gearbox housing (303/17). Move housing (303/3) rearward. Temporarily secure driveshaft (front) housing. Discard packing (303/13). See Figure 303.
(5) Remove retaining ring (303/17) securing gearbox driveshaft (303/12) to gearbox drive coupling (303/18). Slide driveshaft rearward into main gearbox. Temporarily secure driveshaft.
(6) Remove cotter pin (303/4), nut (303/5), and bolt (303/7) securing support link (303/6) to gearbox driveshaft housing (303/8).
(7) Remove cotter pin (304/11), nut (304/15), pin (304/14), bolt (304/10), washer (304/12) and spacer (304/13) that attach the support link (304/8) to lugs on upper wall of left and right sides of gearbox. Discard the washers (304/12). Remove the jack and the gearbox. See Figure 304.
(8) If necessary, remove the support links (304/8) from the engine as follows.
    (a) Remove cotter pin (304/7), nut (304/1), pin (304/2), bolt (304/6), washer (304/5), and spacer (304/4) that attach the support link (304/8) to the gearbox support clevis (304/3) on each side of the engine.
    (b) Remove the support links. Discard the washers (304/5).
(9) Temporarily secure the spherical bearings (304/9) in the support links (304/8) for the gearbox and the support link (303/6) for the gearbox driveshaft housing.
(10) Pass sling through eye of lifting arm and, using hoist, lift gearbox away from engine.
(11) Position second nylon sling through boltholes in support lugs on upper left and right sides of gearbox and attach to second hoist.
(12) Remove lifting arm and handling fixture from gearbox.
(13) Move main gearbox to workbench. Remove hoist and sling.

CAUTION: CARE SHOULD BE TAKEN NOT TO DAMAGE SPLINES ON FRONT AND REAR ENDS OF DRIVESHAFT.

(14) Withdraw gearbox driveshaft (303/12) and driveshaft (front) housing (303/13). Discard packing (303/9).
(15) Position nylon sling through gearbox outer support lugs and attach hoist.
(16) Lift gearbox from workbench and lower onto pallet. Remove hoist and sling.
(17) Install protective covers over gearbox driveshaft housing and opening in angle gearbox.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-34

Task 72-00-61-050-015:

1. Remove The Core Engine EEC Wiring Harnesses W3 And W5 Prior To The Main Gearbox Removal

A. Equipment And Materials Required

Special Tools:
PWA 85749 Torque Adapter, Electronic Harness Connector

B. Procedure
See Figure 301.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE REMOVAL, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) Disconnect the following harness connectors from the components given below. Install a protective closure on each harness connector and mating receptacle. See Figures 301 for the connector to component locations.

Connector	Component	Location
W3P18	EEC Oil Temperature Thermocouple Probe	Front Of Gearbox 7 O'clock
W3P1	EEC Alternator (Upper Connector)	Bottom Of Gearbox 7 O'clock
W5P6	EEC Alternator (Lower Connector)	Bottom Of Gearbox 7 O'clock

NOTE: Use a PWA 85749 Electronic Harness Connector Torque Adapter to disconnect the W5P6 and W3P1 harness connector.

(2) Remove the bolts, nuts, and clamps that attach the W3 and W5 harnesses to brackets, and oil/support tubes. Carefully put harnesses and connectors clear of gearbox to prevent damage when gearbox is removed.

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-35

Task 72-00-61-030-001:

1. Remove Main Oil Filter
   - A. Equipment And Materials Required - None
   - B. Procedure

     See Figure 301.
     - (1) Drain oil from main oil filter housing assembly.
       - (a) Remove lockwire and plug from insert in cover assembly. Hold insert in place with wrench on flats while removing plug. Discard packing.

         NOTE: Be prepared to catch oil in a container with a minimum capacity of 5 U.S. gallons (19 liters).

       WARNING: FILTER COVER IS UNDER SPRING PRESSURE. EXERCISE CARE TO PREVENT PERSONAL INJURY DURING DISASSEMBLY.

     - (2) (Pre PW4ENG 72-524) Remove the main oil filter element from the main oil filter housing assembly. See Figure 301 (Sheets 1 and 2).
       - (a) Remove lockwire, plug (301/12), and insert (301/10) from bottom port in main oil strainer cover (301/15). Discard packings (301/9 and 301/11).
       - (b) Remove four bolts (301/13) and washers (301/14) securing main oil strainer cover (301/15) to main oil filter housing (301/3). Remove cover and filter element (301/4) from housing. Remove filter element. Discard packing (301/8).
       - (c) Remove spring (301/5) from cover. Remove screw (301/6) securing key washer (301/7) to cover. Remove key washer and discard.
     - (3) (Post PW4ENG 72-524 and Pre SB PW4ENG 79-79) Remove the main oil filter element from the main oil filter housing assembly. See Figure 301 (Sheets 3 and 4).
       - (a) Remove lockwire, plug (301/12), and insert (301/10) from bottom port in main oil strainer cover (301/15). Discard packings (301/9 and 301/11).
       - (b) Remove lockwire, if necessary, the four nuts (301/29) or (301/30) and the washers (301/14) that secure the main oil strainer cover (301/15) to main oil filter housing (301/3). Remove cover and filter element (301/4) from housing. Remove filter element. Discard packing (301/8).
       - (c) Remove spring (301/5) from cover. Remove screw (301/6) securing key washer (301/7) to cover. Remove key washer and discard.

(4) (Post SB PW4ENG 72−524 and SB PW4ENG 79−79) Remove the main oil filter element from the main oil filter housing assembly. See Figure 301 (Sheets 5 and 6).
  (a) Remove the lockwire, plug (301/12) and insert (301/10) from the bottom port in the main oil strainer cover (301/21). Discard the packings (301/9 and 301/11).
  (b) Remove the lockwire and the four nuts (301/29) or (301/30) and the washers (301/14) that secure the main oil strainer cover (301/21) to the main oil filter housing (301/3). Remove the cover and the filter element (301/4) from the housing. Remove the filter element. Discard the packing (301/8).
  (c) Remove the spring (301/5) from the cover (301/21). Remove the two screws (301/22) and the two washers (301/20) securing the spring retainer (301/23) to the cover (301/21).

(5) (Post SB PW4ENG 72−525) Remove the main oil filter element from the main oil filter housing assembly. See Figure 301 (Sheets 7 and 8).
  (a) Remove lockwire and plug (301/12), from bottom port in main oil strainer cover (301/42). Discard packing (301/11).
  (b) Remove four nuts (301/29) and washers (301/14) securing main oil strainer cover (301/42) to main oil filter housing (301/3). Remove cover and filter element (301/39) from housing. Remove filter element. Discard packing (301/8).
  (c) Remove retaining ring (301/40) from pressure relief valve (301/41) and remove pressure relief valve from cover (301/42).

Task 72-00-61-050-017:

1. Remove The Magnetic Chip Detector Assemblies

A. General

(1) To remove the full magnetic plug assembly, first remove the plug, then remove the valve. To drain the oil tank, it is necessary to remove the full magnetic plug assembly.

B. Equipment And Materials Necessary

Standard Tools

Fluid Drain Collector/Container (capacity 10 US gal.) (38.0 liter)

C. Procedure

CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC CHIP DETECTOR PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

(1) Remove the magnetic chip detectors from the engine oil tank. See Figure 301.

(a) Remove the PN 50R499 magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (301/4).

2 Put a Fluid Drain Collector/Container under the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (301/5) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (301/3) from the probe. Discard the packing.

6 Remove the valve from the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe into the valve.

9 Remove the packing (301/2) from the small OD end of the valve. Discard the packing.

10 Remove the packing (301/1) from the washer face of the valve. Discard the packing.

11 Remove the probe from the valve again.

(b) Remove the PN 50R485 magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (301/7).

2 Put a Fluid Drain Collector/Container under the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (301/9) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (301/8) from the probe. Discard the packing.

6 Remove the valve from the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe into the valve.

9 Remove the packing (301/6) from the small OD end of the valve. Discard the packing.

10 Remove the packing (301/1) from the washer face of the valve. Discard the packing.

11 Remove the probe from the valve again.

(c) Remove the PN 50R423 (option) magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (301/10) or (301/13).

2 Put a Fluid Drain Collector/Container under the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (301/12) or (301/16) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (301/11) or (301/15) from the magnetic probe. Discard the packing.

6 Remove the valve from the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 If applicable, remove the packing (301/14) from the ID of the valve. Discard the packing.

9 Remove the packing (301/1) from the washer face of the valve. Discard the packing.

(d) Remove the PN 50R374 magnetic chip detector from the engine oil tank as follows:

1 Remove the lockwire or safety cable from the valve (301/17).

2 Put a Fluid Drain Collector/Container under the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (301/19) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (301/18) from the magnetic probe. Discard the packing.

6 Remove the valve from the engine oil tank.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (301/1) from the washer face of the valve. Discard the packing.

CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC CHIP DETECTOR PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

(2) Remove the magnetic chip detectors from the lubrication and scavenge oil pump. See Figure 302.

(a) Remove the PN 50R342 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (302/2).

2 Put a Fluid Drain Collector/Container under the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (302/4) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (302/3) from the probe. Discard the packing.

6 Remove the valve from the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (302/1) from the washer face of the valve. Discard the packing.

9 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(b) Remove the PN 50R348 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (302/8).

2 Put a Fluid Drain Collector/Container under the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (302/5) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (302/6) from the probe. Discard the packing.

6 Remove the valve from the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (302/7) from the ID of the valve. Discard the packing.

9 Remove the packing (302/1) from the washer face of the valve. Discard the packing.

10 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(c) Remove the PN 50R492 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (302/10).

2 Put a Fluid Drain Collector/Container under the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (302/12) in and turn it counterclockwise to disengage it from the valves.

4 Remove the probe from the valve.

5 Remove the packing (302/11) from the probe. Discard the packing.

6 Remove the valve from the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe (302/12) into the valve (302/10).

9 Remove the packing (302/9) from the small OD end of the valve. Discard the packings.

10 Remove the packing (302/1) from the washer face of the valve. Discard the packing.

11 Remove the magnetic probe from the valve again.

12 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(d) Remove the PN 50R491 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (302/16).

2 Put a Fluid Drain Collector/Container under the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (302/13) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (302/14) from the probe. Discard the packing.

6 Remove the valve from the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (302/15) from the ID of the valve. Discard the packing.

9 Remove the packing (302/1) from the washer face of the valve. Discard the packing.

10 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(e) Remove the PN 50R501 magnetic chip detectors from the lubrication and scavenge oil pump as follows:

1 Remove the lockwire or safety cable from the valve (302/18).

2 Put a Fluid Drain Collector/Container under the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (302/20) in and turn it counterclockwise to disengage it from the valves.

4 Remove the probe from the valve.

5 Remove the packing (302/19) from the probe. Discard the packing.

6 Remove the valve from the lubrication and scavenge oil pump.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe (302/20) into the valve (302/18).

9 Remove the packing (302/17) from the small OD end of the valve. Discard the packings.

10 Remove the packing (302/1) from the washer face of the valve. Discard the packing.

11 Remove the magnetic probe from the valve again.

12 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

CAUTION: INSTALL PROTECTIVE COVERS OVER ALL OPENINGS AS SOON AS POSSIBLE TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO REMOVE THE MAGNETIC CHIP DETECTOR AS AN ASSEMBLY. THE MAGNETIC PROBE MUST BE REMOVED FROM THE VALVE TO PREVENT DAMAGE TO THE PART.

(3) Remove the magnetic chip detector from the center front side of the main gearbox assembly. See Figure 303.

(a) Remove the PN 50R341 magnetic chip detector from the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (303/2).

2 Put a Fluid Drain Collector/Container under the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (303/4) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (303/3) from the probe. Discard the packing.

6 Remove the valve from the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (303/1) from the washer face of the valve. Discard the packing.

(b) Remove the PN 50R347 magnetic chip detector from the main gearbox assembly:

1 Remove the lockwire or safety cable from the valve (303/5).

2 Put a Fluid Drain Collector/Container under the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (303/8) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (303/7) from the probe. Discard the packing.

6 Remove the valve from the main gearbox assembly.

a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (303/6) from the ID of the valve. Discard the packing.

9 Remove the packing (303/1) from the washer face of the valve. Discard the packing.

(c) Remove the PN 50R485 magnetic chip detector from the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (303/10).

2 Put a Fluid Drain Collector/Container under the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (303/12) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (303/11) from the probe. Discard the packing.

6 Remove the valve from the main gearbox assembly as follows:

a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe into the valve.

9 Remove the packing (303/9) from the small OD end of the valve. Discard the packing.

10 Remove the packing (303/1) from the washer face of the valve. Discard the packing.

11 Remove the probe from the valve again.

(d) Remove the PN 50R484 magnetic chip detector from the center front side of the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (303/13).

2 Put a Fluid Drain Collector/Container under the center front side of the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (303/16) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (303/15) from the probe. Discard the packing.

6 Remove the valve from the main gearbox as follows:

a Hold the bushing with a wrench so it does not turn.

b Remove the valve from the bushing.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Remove the packing (303/14) from the ID of the valve. Discard the packing.

9 Remove the packing (303/1) from the washer face of the valve. Discard the packing.

(e) Remove the PN 50R499 magnetic chip detector from the center front side of the main gearbox assembly as follows:

1 Remove the lockwire or safety cable from the valve (303/18).

2 Put a Fluid Drain Collector/Container under the main gearbox assembly.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

3 Push the magnetic probe (303/20) in and turn it counterclockwise to disengage it from the valve.

4 Remove the probe from the valve.

5 Remove the packing (303/19) from the probe. Discard the packing.

6 Remove the valve from the main gearbox assembly as follows:

  a Hold the bushing with a wrench so it does not turn.

  b Remove the valve from the bushing.

WARNING: BE CAREFUL WHEN YOU DRAIN OIL FROM A HOT ENGINE. HOT OIL IS DANGEROUS. IF IT TOUCHES YOUR BODY OR EYES, IT WILL BURN BADLY.

7 Let the oil drain into the Fluid Drain Collector/Container.

8 Install the magnetic probe into the valve.

9 Remove the packing (303/17) from the small OD end of the valve. Discard the packing.

10 Remove the packing (303/1) from the washer face of the valve. Discard the packing.

11 Remove the probe from the valve again.

Task 72-00-61-040-002:

1. Remove The Oil Tank Cap

A. Procedure

See Figures 301 and 302.

- (1) Lift the handle of the cap.
- (2) Turn the cap counterclockwise.
- (3) Remove the cap. Examine the packing (302/7). If it is torn, cut, or shows deterioration, remove and discard it.
- (4) If Inspection/Check-05 (Task 72-00-61-200-001) showed that the packing in the cap was defective, remove the packing as follows. See Figure 302.
  - (a) Remove the handle (302/2) as follows:
    - 1 Push the cap (302/2) and lock (302/10) together.
    - 2 While they are pushed together, remove the pin (302/3) with a drift.
    - 3 Remove the handle (302/2).
  - (b) Slowly release the pressure on the cap and lock. The washer (302/4), cap (302/6), spring (302/9), plate (302/8), and lock (302/10) will move apart.
  - (c) Discard the packing (302/5).

ENGINE GENERAL - MAIN GEARBOX - REMOVAL-39

Task 72-00-61-050-019:

1. Remove The No. 3 Bearing Breather And Restrictor Valve (Pre SB PW4ENG 75-144)

   A. Procedure
   See Figure 301.

      (1) Remove the No. 3 bearing breather and restrictor valve as follows.

         (a) Remove the lockwire from the tube nut on the No. 3 bearing breather and restrictor valve air supply tube (AP39).

         (b) Disconnect the tube nut from the restrictor valve.

         (c) Remove the three bolts that attach the No. 3 bearing breather tube (LB04) to the restrictor valve. Remove the seal face from between the tube and the valve.

         (d) Remove the three bolts that attach the valve to the deoiler on the gearbox.

         (e) Remove the restrictor valve from the gearbox. Discard the packing from the valve.

         (f) Install protection covers to all openings.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-01

Task 72-00-61-420-001:

1. Install Main Gearbox

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-61-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 24667	Jack, Hydraulic (Optional to PWA 80611)
PWA 80611	Jack, Hydraulic
PWA 85123	Fixture, Handling (Optional to PWA 86056)
PWA 85768	Puller
PWA 86056	Fixture, Handling

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	72-00-61/1/20
Cotter Pin	2	72-00-61/1/100
Cotter Pin	2	72-00-61/1/160
Packing	1	72-62-00/6/20
Packing	1	72-62-00/6/30
Washer	2	72-00-61/1/70
Washer	2	72-00-61/1/130

C. Procedure

(1) Align boltholes and position PWA 86056 or PWA 85123 Fixture to lifting pad of PWA 24667 or PWA 80611 Hydraulic Jack. Secure fixture to jack with three detail screws. See Figure 401.

(2) Position nylon sling through gearbox outer support lugs, located on top left and right sides of gearbox, and attach hoist.

(3) Using hoist, lift gearbox and position over fixture. Lower gearbox and position four post details of adapter to four ground handling points of gearbox. Secure post details to gearbox with four detail bolts (401/1).

(4) Install new packings, lubricated with Engine Oil P03−001, on gearbox driveshaft (front) housing (402/3). See Figure 402.

  (a) Install packing (402/9) in groove on rear of housing.

  (b) Install packing (402/13) in groove on front of housing.

(5) Insert gearbox driveshaft (402/12) and driveshaft (front) housing (402/3) in driveshaft housing (402/8) and telescope rearward, carefully mating driveshaft splines with internal splines on gearbox spline lockring.

(6) If not installed on the engine, install the two support links (403/8) in the gearbox support clevises (403/3) on Flange K. See Figure 403.

  (a) With the support links in position in the clevises, install the spacers (403/4) in the rear holes of the clevises. Install the pins (403/2), flanged ends forward, in the front holes of the clevises.

  (b) Install new washers (403/5) on the bolts (403/6). Install the bolts, heads rearward and threads lubricated with Engine Oil P03−001, in the spacers. Install nuts (403/1) on the bolts.

  (c) Torque the bolts to 290 − 325 lb−in. (32.766 − 36.720 N.m). Install a cotter pin (403/7) in each bolt.

(7) Make sure that spherical bearings (403/9) are installed in support links (403/8) and in the lower end of the (driveshaft housing) support link (402/6). Make sure that the bearings turn freely.

(8) Move jack beneath engine and raise gearbox to align lug on top center of gearbox with mating part on compressor case and align support links (403/8) on engine with lugs on upper right and left sides of gearbox.

(9) Install the gearbox on the support links (403/8) as follows.

(a) Install spacer (403/13) into hole in rear of the clevis on the gearbox. Insert pin (403/14), flanged end toward the front, through clevis on gearbox.

(b) Install a new washer (403/12) on the bolt (403/10). Install the bolt, head rearward and threads lubricated with Engine Oil P03−001, in the clevis. Install a nut (403/15) on the bolt.

(c) Torque the bolt to 290 − 325 lb−in. (32.766 − 36.720 N.m). Secure nut using cotter pin (403/11).

(d) Repeat procedure to secure support link to clevis on right side of gearbox.

(10) Align bolthole in support link (402/6) spherical bearing with boltholes in clevis on gearbox driveshaft housing (402/8). Secure support link using bolt (402/7) and nut (402/5). Torque nut to 515 − 575 lb−in. (58.187 − 64.966 N.m). Secure nut using cotter pin (402/4). See Figure 402.

(11) Position retaining ring (402/14) on forward end of driveshaft (402/12). Move driveshaft forward carefully, mating driveshaft splines with internal splines in gearbox drive coupling (402/18). Install retaining ring (402/14) in coupling in angle gearbox to secure front end of driveshaft.

NOTE: Driveshaft must mate, in front, with angle gearbox drive coupling (402/18) splines and, in rear, with main gearbox drive gearshaft teeth. If splines/teeth are out of alignment, driveshaft will not seat in drive coupling

(402/18). In order to align angle and main gearbox splines/teeth, remove the bolts and washers in the gearbox that attach the cover (manual crank). Remove the cover. Use PWA 85768 Puller. Discard the packing. Rotate main gearbox drive gearshaft by turning the gearshaft. To install the cover, install a new packing, lubricated with Engine Oil P03−001, on the cover. Install the cover. Attach it with washers and bolts. Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(12) Align boltholes and telescope gearbox driveshaft (front) housing (402/3) forward and seat on rear flange of angle gearbox housing (402/17). Position bracket (402/1) over top right bolthole in driveshaft (front) housing (402/3) and install bolt (402/10). Position bracket (402/2) over top left bolthole in driveshaft (front) housing and install bolt (402/10). Install washers (402/11) onto four remaining bolts (402/10) and install bolts through remaining boltholes in driveshaft (front) housing and angle gearbox housing. Install washers (402/16) and nuts (402/15) to all six bolts. Torque bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(13) Lubricate four bolts (401/2) with Engine Oil P03−001. Install two bolts in each bracket securing driveshaft (front) housing to high pressure compressor. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(14) Remove gearbox handling fixture bolts (401/1). Lower jack and remove from beneath engine.

(15) Remove three detail screws securing fixture to jack. Remove handling fixture from jack using hoist and sling.

D. Postrequisites

(1) Install the magnetic chip detector assemblies in the oil tank and main gearbox. Refer to Installation−36 (Task 72−00−61−450−017).

(2) Connect/install external parts to complete installation of main gearbox per Installation−02 (Task 72−00−61−420−002).

(3) Install ignition exciters per Installation−03 (Task 72−00−61−450−001) and Installation−04 (Task 72−00−61−450−002).

(4) Install exciter−to−igniter plug cable (lower pluglower box), per 72−00−41, Installation−05 (Task 72−00−41−450−002).

(5) Install exciter−to−igniter plug cable (upper plugupper box), per 72−00−41, Installation−04 (Task 72−00−41−450−001).

(6) Install fuel pump and fuel metering unit (package) per Installation−05 (Task 72−00−61−450−003).

(7) Connect EEC core engine wiring harnesses W3, W4 and W5 to main gearbox per Installation−34 (Task 72−00−61−450−015).

(8) Service engine oil system per 72−00−00, Servicing−03 (Task 72−00−00−610−003).

(9) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-02

Task 72-00-61-420-002:

1. Install The Main Gearbox Plumbing After The Main Gearbox Installation

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-021	Compound, Antigalling (PWA 550)
P06-036	Compound, Antigallant(PWA 36035)
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	79-21-00/7/1

B. Procedure
See Figure 401 through 404.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-02

R CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL
R ALL TUBES WHICH CONTAIN A FLEX DESIGN
R SEGMENT. REMOVE AND INSTALL A TUBE WITH A
R FLEX SEGMENT WITH THE SAME PRECAUTIONS
R USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO
R NOT BEND THE FLEXHOSE OF A TUBE TO HELP
R WITH THE INSTALLATION OR REMOVAL OF AN
R ATTACHED COMPONENT. IF A FLEX SEGMENT IS
R BENT TOO MUCH, THIS CAN CAUSE A KINK IN
R THE EXTERNAL WIRE BRAID AND IN THE INNER
R POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS
R OR TUBE RUPTURE CAN BE THE RESULT.

(1) Install the ground cable as follows. See Figure 401.

(a) If the ground cable was removed from the diffuser case, do as follows.

1 Remove the lockwire and the bottom bolt that attaches the No. 3 bearing oil vent tube lock plate.

2 Install the bolt with the ground cable, angled down and forward. Torque the bolt to 75 - 85 lb-in. (8.474 - 9.604 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolt.

(b) If the ground cable was removed from the gearbox, do as follows.

1 Remove the oil tank flange bolt and install it with the ground cable.

2 Torque the bolt to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(2) (Post SB PW4ENG 75-95 and Pre SB PW4ENG 75-144) Install the No. 3 bearing breather valve, air supply tube (AP39) as follows. See Figure 402.

(a) Remove the protection covers from the tube.

(b) (Pre SB PW4ENG 79-52), Lubricate the threads of the tube nuts tand the back surface of the ferrules with Antigallant Compound P06-036. See Figure 402 (Sheet 6).

(c) (Post SB PW4ENG 79-52), Lubricate the threads of the tube nuts and the back surface of the ferrules with Antigallant Compound P06-021. See Figure 402 (Sheet 7).

(d) Install the tube to the bottom of the high compressor case and connect one end of the tube to the No. 3 bearing breather and restrictor valve on the front right side of the main gearbox. Connect the other end of the tube to a fitting on the No. 3 bearing cooler air tube (AP34) located at the 4 o'clock position on the high compressor case. Tighten the tube nuts by hand.

(e) Install clamps to the tube as follows.

1 With a clamp on the oil cooler outlet fuel tube (FM11), install a clamp on the tube sleeve of the tube (AP39) and attach the clamps together with a bolt, threads lubricated with Engine Oil P03-001 and a nut.

2 Install a clamp to the tube and attach the clamp to a bracket on the gearbox driveshaft housing, support link mount with a bolt, threads lubricated with Engine Oil P03-001.

3 Install a clamp to the tube and attach the clamp to bracket that is located on the air vent diffuser seal tube (AP21) flange. Attach the clamp to the bracket with a bolt, threads lubricated with Engine Oil P03-001.

(f) Torque the clamp bolts/nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(g) Torque the tube nut to the No. 3 bearing cooler air tube (AP34) and the tube nut to the No. 3 bearing breather and restrictor valve to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nuts.

(3) (Post SB PW4ENG 75-144), Install cap assembly to the (AP34) manifold assembly as follows:

(a) Apply Antigalling Compound P06−021 to the treads on nut and install cap assembly to the tee of the (AP34) manifold assembly.

(b) Torque the cap assembly to 200 − 225 lb−in. (22.597 − 25.422 N.m). Secure with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(4) Connect the (lower) No. 3 bearing breather tube assembly (LB04) as follows.

(a) Remove the cover.

(b) (Pre SB PW4ENG 75−95), Install the packing lubricated with Engine Oil P03−001 to the packing groove on the lower end of the tube.

(c) (Post SB PW4ENG 75−95 and Pre SB PW4ENG 75−144) Install a three hole seal face to the No. 3 bearing breather restrictor valve that is located on the right front side of the gearbox.

(d) Lubricate the tube nut threads with Antigalling Compound P06−021. See Figure 401 (Sheet 11). Connect the tube to the upper tube at 9:30 o'clock position adjacent to Flange K. Tighten by hand.

(e) (Pre SB PW4ENG 75−95), Remove the temporary lockwire and install the flanged end to the outboard port on the front of the gearbox. Install the three bolts, lubricated with Engine Oil P03−001 and tighten by hand.

(f) (Post SB PW4ENG 75−95 and Pre SB PW4ENG 75−144) Install the flanged−end of the tube to the No. 3 bearing breather restrictor valve on the right front side of the main gearbox. Install three bolts, lubricated with Engine Oil P03−001 and tighten by hand.

(g) Install the clamp that attaches the tube to the bracket on the fuel/oil cooler rear support (Pre SB PW4ENG 72−211 only). Attach the clamp with the bolt, lubricated with Engine Oil P03−001. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) Install the clamp that attaches the tube to the bracket on the HPC air valve (Post SB PW4ENG 72-211 only). Attach the clamp with the bolt, lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(i) Torque the three bolts that attach the tube to the gearbox or restrictor valve (Post SB PW4ENG 75-95) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(j) Torque the tube nut to 675 - 750 lb-in. (76.265 - 84.739 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the tube nut.

(5) Connect the (lower) No. 1 and 2 bearing breather tube assembly (LB02) as follows.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03-001, to the packing groove at the flanged end of the tube.

(b) Remove the temporary lockwire and install the flanged end to the inboard port on the front of the gearbox. Install the bracket and three bolts, lubricated with Engine Oil P03-001. Tighten the bolts by hand.

(c) Locate the clamp that attaches the tube to the Flange H bracket at 8:30 o'clock position. Attach the clamp with the bolt, lubricated with Engine Oil P03-001, and nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Install a clamp to the (lower) breather tube (LB02) and attach the clamp to the inboard oil cooler bracket with a bolt, threads lubricated with Engine Oil P03-001 and a nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Section C-C (Post SB PW4ENG 79-33).

(e) Torque the three bolts that attach the tube to the gearbox to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(f) Attach the (lower) tube (LB02) nut to the (middle) tube (LB06) nut above the Fuel/Oil Cooler, at approximately 9 o'clock position. Torque the tube nut to 1150 − 1300 lb−in. (129.993 − 146.880 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(6) Install the air cooler inlet oil tube assembly (LP02) as follows.

(a) Remove the covers. Install the packings, lubricated with Engine Oil P03−001, to the packing groove at each end of the tube.

(b) Install the tube to the air oil cooler and the top of the main oil filter housing. Install the three bolts, lubricated with Engine Oil P03−001, at each end. Tighten them by hand.

(c) Install the clamp that attaches the tube to the Flange H bracket. Attach the clamp with the bolt, lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the three bolts at each end of tube to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(7) Install the oil trim pressure tube assembly (LP32) as follows:

CAUTION: DO THIS PROCEDURE EXACTLY AS FOLLOWS OR TUBE FAILURE CAN RESULT.

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

(a) Be sure the following parts are loose. If any parts are not loose, be sure and loosen them and then tighten by hand only.

1 Both ends of the No. 3 bearing oil pressure manifold (LP18) located above the oil cooler.

2 Both ends of the oil trim pressure tube (LP31) located between the No. 3 bearing oil pressure manifold (LP18) and the oil metering nipple (restrictor).

3 The tube nut that attaches the No. 3 bearing oil pressure tube (LP19) to the diffuser case located at approximately 9:30 o'clock position.

4 The clamp bolts that attach all the tubes above to the engine brackets or to each other.

(b) (Pre SB PW4ENG 79-52), Lubricate the back surface of the ferrules with Antigallant Compound P06-036 on each end of the tubes that follow. See Figure 402 (Sheet 6).

(c) (Post SB PW4ENG 79-52), Lubricate the back of the ferrule of the N0. 3 bearing manifold (LP18) with Antigallant Compound P06-021. See Figure 402 (Sheet 7).

(d) Lubricate the back surface of ferrule with Antigallant Compound P06-036 on the oil trim pressure tube (LP31). See Figure 402 (Sheet 7).

NOTE: Loosen or remove the tube nuts as necessary to apply the lubricant to the back side of the ferrules. After you apply the lubricant, tighten the tube nuts by hand only.

(e) Remove the protection covers and lubricate the oil trim pressure tube (LP32) nut threads with Antiseize Paste P06-054. Wipe off unwanted paste. Lubricate the back surface of the ferrule with Antigallant Compound P06-036. Install the packing, lubricated with Engine Oil P03-001, to the flanged end of the tube. Install the tube to the main oil filter housing and attach with three bolts lubricated with Engine Oil P03-001. Tighten the bolts by hand. Tighten the tube nut by hand.

(f) (Reference 2016) Be sure that the center of the forward clamp (on the (LP32) oil trim pressure tube) is 2.500 - 3.000 inches (63.500 - 76.200 mm) from the center of the rear clamp (Post SB PW4ENG 72-211 only).

(g) With all the tube nuts above only handtight, torque the clamp bolts and tubes exactly as follows:

1 The clamp bolt that attaches the back to back clamps (LP18) to (LP32) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

2 The clamp bolt(s) that attach the tubes to the oil cooler rear bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m).

3 (Pre SB PW4ENG 79-52), the clamp bolt that attaches the No. 3 bearing oil strainer (LP19) to the Flange K bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m).

4 (Post SB PW4ENG 79-52), the bolts that attach the ferrule end of the No. 3 bearing pressure tube (LP19) to the bracket on Flange K to 36 - 40 lb-in. (4.067 - 4.519 N.m).

5 The three bolts that attach the oil trim pressure tube (LP32) to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

CAUTION: YOU MUST USE THE WRENCHING FLATS ON THE MATING PARTS WHEN YOU LOOSEN OR TIGHTEN ANY OR ALL TUBE NUTS. THIS WILL PREVENT ANY TWIST DAMAGE TO THE TUBES.

6 The front tube nut of the (LP18) manifold to strainer housing to 140 - 160 lb-in. (15.818 - 18.078 N.m), then loosen and torque again to the same value.

7 The front tube nut of the oil trim pressure tube (LP31) to the No. 3 bearing oil pressure manifold (LP18) tee to 675 - 750 lb-in. (76.265 - 84.739 N.m).

8 The tube nuts (LP31) and (LP32), that attach the oil tube metering nipple (restrictor) to 675 - 750 lb-in. (76.265 - 84.739 N.m).

9 (Post SB PW4ENG 79-52), Install a clamp to the tube nut end of the oil trim pressure tube (LP32) and attach the clamp to a bracket on the secondary flow control valve flange with a bolt, threads lubricated with Engine Oil P03-001 and a nut.

10 Torque the nut to 36 - 40 (4.067 - 4.519 N.m).

11 The tube nut that attaches the (rear) No. 3 bearing oil pressure tube (LP19) to the diffuser case to 450 - 500 lb-in. (50.843 - 56.492 N.m).

12 (Pre SB PW4ENG 79-52), the manifold nut (LP18) to the No. 3 bearing oil strainer at Flange K to 675 - 750 lb-in. (76.265 - 84.739 N.m).

13 (Post SB PW4ENG 79-52), the two nuts that attach the adapter to the ferrule end of No. 3 bearing pressure tube (LP19) to 36 - 40 lb-in. (4.067 - 4.519 N.m).

14 (Post SB PW4ENG 79-52), the manifold nut (LP18) to the adapter on the No. 3 bearing pressure tube (LP19) at Flange K to 675 - 750 lb-in. (76.265 - 84.739).

(h) Install the lockwire at all necessary locations.

(i) (Pre SB PW4ENG 79-52), Install the spray shield to the inboard side of the rear manifold (LP18) connection at the No. 3 bearing strainer. Attach the shield with the hose clamp.

(j) (Pre SB PW4ENG 79-52), (Reference 2151) Torque the hose clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(k) (Post SB PW4ENG 79-52), Install the spray shield to the inboard side of the rear manifold (LP18) that is attached to the No. 3 bearing pressure tube (LP19). Attach the spray shield with a clamp and a bolt, threads lubricated with Engine Oil P03-001, to a bracket attached to the flange of the cooling air tube on the high compressor. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) Install the oil bypass drain tube assembly (LP20) as follows.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03−001, to the packing groove at the flanged end of the tube. Install the packing, lubricated with Engine Oil P03−001, and retainer to the other end of the tube.

(b) Lubricate the tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste. Install the tube to the inboard side of the main oil filter housing and to the oil bypass valve.

(c) Install the two bolts, lubricated with Engine Oil P03−001, that attach the tube to the housing. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque tube nut to 65 − 70 lb−in. (7.344 − 7.909 N.m), loosen tube nut, then retorque to 65 − 70 lb−in. (7.344 − 7.909 N.m) and install Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(9) Install the reduction gearbox oil pressure tube assembly (LP13) as follows.

(a) Remove covers. Lubricate the tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste.

(b) Install the tube to the manifold tee at 7 o'clock position and to the reduction gearbox adapter.

(c) Torque each tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nuts.

(10) Install the main gearbox oil pressure tube assembly (LP12) as follows.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03−001, to the packing groove at the flanged end of the tube.

(b) Lubricate the tube nut threads with Antiseize Paste P06−054. Wipe off unwanted paste. Install the tube to the manifold tee at 7 o'clock position and to the main gearbox.

(c) Install the two bolts, lubricated with Engine Oil P03−001, that attach the tube flange to the gearbox.

(d) Install the clamp that attaches the tube to the gearbox bracket. Attach the clamp with the bolt, lubricated with Engine Oil P03−001, and nut. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the two bolts at the flanged end of the tube to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Torque the tube nut to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(g) (Reference 2151) Install the spray shield, clamp half, hose clamp, bolts, lubricated with Engine Oil P03−001, and nuts to the manifold tee. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque the hose clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(11) Install the EEC wiring harness support tube assembly as follows.

(a) Remove the lower bolt that attaches the bracket to the No. 1 and 2 bearing, breather tube flange.

(b) Install the bolt again with the support tube in position.

(c) Install the bolt, lubricated with Engine Oil P03−001, and nut that attach the support tube to the air cooler outlet oil tube clamp. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the bolt that attaches the support tube to the gearbox to 85 − 95 lb−in. (9.604 − 10.734 N.m).

R
R

(12) (Pre SB PW4ENG 79-75) Install the main filter oil tube assembly (LP01) as follows. See Figure 403 (Sheets 1 through 6).

NOTE: If PWA 26157 Pedestal and PWA 85062 Saddle are installed forward of Flange M, see 72-00-54, Installation-02 Task 72-00-54-420-003 for the tube installation after the removal of the pedestal and the saddle.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03-001, to the packing groove at each end of the tube.

(b) Install the tube to the main oil filter housing. Install the three bolts, lubricated with Engine Oil P03-001. Tighten the bolts by hand.

(c) Install the tube to the main oil pump port. Install the bracket and the two bolts, lubricated with Antiseize Paste P06-054. Wipe off unwanted paste. Tighten the bolts by hand.

(d) Install the six (clip-on) loop clamp grommet halves (Post SB PW4ENG 79-36 only) at the three rearward clamp locations.

(e) Install the three clamps that attach the tube to the gearbox brackets and diffuser case bracket. Attach the clamps with the bolts, lubricated with Engine Oil P03-001, and nuts. Torque the bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(f) Torque the bolts that attach the tube to the oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(g) Torque the bolts that attach the tube to the oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-02

(13) (Post SB PW4ENG 79-75) Install the fluid pressure dampener or fluid pressure adapter assembly (Post SB PW4ENG 79-86) and install the main oil filter hose and tube assembly (LPO1) as follows. See Figure 403.

NOTE: If PWA 26157 Pedestal and PWA 85062 Saddle are installed forward of Flange M, see 72-00-54, Installation-02 Task 72-00-54-420-003 for the tube installation after the removal of the pedestal and the saddle.

(a) Remove protective closures and install packing lubricated with Engine Oil P03-001, to packing groove on the dampener or adapter.

(b) Install the dampener or adapter to the top of the main oil pump and hold with bolts, threads lubricated with Engine Oil P03-003, to a handtight condition only.

(c) Remove protective closures and install packing lubricated with Engine Oil P03-003, to packing groove at each end of oil tube assembly (LP01).

(d) Install one end of tube (LP01) to the forward side of the main oil filter housing with with bolts, threads lubricated with Engine Oil P03-003, handtight only.

(e) Install the other end of tube (LP01) to the dampener or adapter, threads lubricated with Engine Oil P03-003, to a handtight condition only.

(f) Install bolts, threads lubriated with Engine Oil P03-003, nuts and clamps securing tube to gearbox brackets, handtight only.

(g) Install bolts, threads lubricated with Engine Oil P03-003, on the tube (LP01) which attaches to the diffuser case bracket.

(h) Torque all the clamp bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(i) Torque the bolts that hold the dampener or adapter to the top of the main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(j) Torque the bolts securing the tube (LP01) to the main oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(k) Torque the bolts that hold the tube (LP01) to the dampener or adapter to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(l) Torque the bolts securing the tube (LP01) to the diffuser case bracket to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(14) (Post SB PW4ENG 79-75) Install the loop clamp bracket assembly on the fluid pressure dampener or adapter as follows.

(a) Secure bracket assembly to the dampener or adapter with bolts and nuts to a handtight condition only.

(b) Torque the bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(15) (Pre SB PW4ENG 79-75) Install the No. 3 bearing oil scavenge manifold assembly (LR04) as follows. See Figure 403.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03-001, to the groove at the flanged end of the manifold.

(b) Lubricate the elbow threads with Engine Oil P03-001. Install the manifold to the diffuser case internal tube at 6 o'clock position and to the oil pump.

(c) Install the three bolts, lubricated with Antiseize Paste P06-054, that attach the manifold to the pump. Wipe off unwanted paste.

(d) Install the clamp, bolt, lubricated with Engine Oil P03-001, and nut that attach the manifold to the oil pump bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(f) Hold manifold elbow from turning and torque diffuser case internal tube nut to 650 - 700 lb-in. (73.440 - 79.089 N.m). Secure with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Install the two loop clamp grommet halves (Post SB PW4ENG 79-46) to the manifold adjacent to the oil pump clamp. Loosen the clamp bolt that attaches the manifold clamp to the oil pump bracket.

NOTE: Torque the clamp bolt again after the installation of the No. 4 bearing oil scavenge tube (LR05).

(16) (Post SB PW4ENG 79-75) Install the No. 3 bearing oil scavenge hose and manifold assembly (LR04) as follows. See Figure 403 (Sheets 18 through 20).

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03-001, to the groove at the flanged end of the manifold.

(b) Lubricate the elbow threads with Engine Oil P03-001. Install the hose and manifold assembly to the diffuser case internal tube nut at 6 o'clock position and to the oil pump.

(c) Install the three bolts, lubricated with Antiseize Paste P06-054, that attach the manifold to the pump. Wipe off unwanted paste.

(d) Install the clamp, bolt, lubricated with Engine Oil P03-001, and nut that attach the manifold to the oil pump bracket. Torque the clamp bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the bolts securing the manifold flange to the main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(f) Hold the manifold elbow from turning and torque diffuser case internal tube nut to 650 - 700 lb-in. (73.440 - 79.089 N.m). Secure with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(g) Secure the hose and manifold assembly to the fluid pressure dampener or adapter bracket and the fuel injector support bracket with two loop clamps using four nuts and bolts lubricated with Engine Oil P03-001. Torque the bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(h) Loosen the clamp bolt that attaches the manifold clamp to the oil pump bracket.

NOTE: Torque the clamp bolt again after the installation of the No. 4 bearing oil scavenge tube (LR05).

(17) (Pre SB PW4ENG 79-75) Install the (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows.

NOTE: If the PWA 26157 Pedestal and the PWA 85062 Saddle are been installed forward of Flange M, see 72-00-54, Installation-02 (Task 72-00-54-420-003) for the installation of this tube.

(a) Remove the covers. Install the packing lubricated with Engine Oil P03-001, to the packing groove at the flanged end of the tube.

(b) Lubricate the tube nut threads with Antiseize Paste P06-054, wipe off unwanted paste. Install the tube to the oil pump port and to the rear scavenge tube adjacent to Flange M.

(c) Install the three bolts, lubricated with Antiseize Paste P06-054, that attach the tube to the pump. Wipe off unwanted paste. Tighten by hand.

(d) Install the six loop clamp grommet halves (Post SB PW4ENG 79-46). Install clamps that attach the tube (LR05) to the main filter oil tube (LP01), the No. 3 bearing oil scavenge manifold (LR04), and the oil pump bracket. Install the clamp bolts, lubricated with Engine Oil P03-001, and nuts. Torque the clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Torque the bolts that attach the tube to the oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(f) Torque the tube nut to 475 − 525 lb−in. (53.668 − 59.317 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(g) Install the spray shield to the inboard side of the connection. Install the clamp, bolt, lubricated with Engine Oil P03−001, and nut that attach the spray shield and tube to the Flange M bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(h) (Reference 2151) Install the hose clamp to the spray shield and torque it to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(18) (Post SB PW4ENG 79−75) Install (front) No. 4 bearing oil scavenge tube assembly (LR05) as follows. See Figure 403 (Sheets 21 through 24).

(a) Remove protective closures and install packing lubricated with Engine Oil P03−001, to flanged end of tube.

(b) Lubricate threads on tube nut with Antiseize Paste P06−054, and install tube to rear scavenge tube at Flange M and to port on main oil pump with bolts, threads lubricated with Antiseize Paste P06−054, handtight only. Wipe off unwanted paste.

(c) Install the loop clamp bracket on the TCC manifold bridge bracket and secure with the clamp bolts, lubricated with Engine Oil P03−001, and nuts. Torque the clamp bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(d) Torque bolts securing tube flange to main oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(e) Torque tube nut to 475 − 525 lb−in. (53.668 − 59.317 N.m) and secure with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut.

(f) Secure hose and tube assembly to the loop clamp bracket on the TCC manifold bridge bracket and the loop clamp bracket assembly on the fluid pressure dampener or adapter with clamps and bolts, lubricated with Engine Oil P03−001. Torque the bolts to 27 − 30 lb−in. (3.051 − 3.390 N.m).

(19) Install the angle gearbox oil scavenge tube assembly (LR01) as follows.

(a) Remove the covers. Install the packings, lubricated with Engine Oil P03−001, to the packing grooves at each end of the tube.

(b) Install the tube to the angle gearbox port and the main oil pump port.

(c) Attach the tube to the angle gearbox with two bolts, lubricated with Engine Oil P03−001. Tighten the bolts by hand.

(d) Attach the tube to the main oil pump with two bolts, lubricated with Antiseize Paste P06−054. Wipe off unwanted paste. Tighten the bolts by hand.

(e) Install the clamps that attach the tube to the gearbox brackets. Attach the clamps with the bolts, lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque the bolts that attach the tube to the angle gearbox to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque the bolts that attach the tube to the main oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(20) Install the No. 1, 1.5, and 2 bearing oil scavenge tube assembly (LR03) as follows.

(a) Remove the covers. Install the packing, lubricated with Engine Oil P03−001, to the flanged end of the tube.

(b) (Post SB PW4ENG 79−58), Install a strainer element into the flanged−end of the tube.

(c) Lubricate the tube nut threads with Engine Oil P03−001. Install the tube to the main oil pump and to the tube adjacent to Flange E at 7 o'clock position.

(d) Install the three bolts, lubricated with Antiseize Paste P06−054, that attach the tube to the pump. Wipe off unwanted paste. Tighten the bolts by hand.

(e) Install the four clamps that attach the tube to the gearbox and HPC case brackets. Attach the clamps with the bolts, lubricated with Engine Oil P03−001, and nuts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Torque the bolts that attach the tube to the oil pump to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(g) Torque the tube nut to 1300 − 1400 lb−in. (146.880 − 158.179 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the tube nut. See Figure 403.

(21) (Post SB PW4ENG 72−491) Install the deoiler idler bearing pressure line (LP35) as follows. See Figure 404.

(a) Remove protective closures from the two end nuts.

(b) Position the line to the gearbox and install the nut on the end of the line bent at 90 degrees to the deoiler (idler) spur gear adapter assembly in the gearbox.

(c) Install the nut on the straight end of the line to the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15).

(d) Torque the nut to the deoiler (idler) spur gear adapter assembly to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(e) Torque the nut to the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15) to 340 − 375 lb−in. (38.415 − 42.369 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nut.

(f) Install clamps and bolts, threads lubricated with Engine Oil P03−001, to hold the line to the oil tank mount flange bracket and to the overboard breather pad bracket. Torque the clamp bolts to 36 − 41 lb−in. (4.067 − 4.519 N.m).

(g) Position the spray shield to the tee fitting connection and attach with the hose clamp. Torque the clamp to 15 − 18 lb−in. (1.695 − 2.034 N.m).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-03

Task 72-00-61-450-001:

1. Install Ignition Exciter (Lower Exciter)

A. Equipment And Materials Required

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-005	Cloth, Cotton Lint Free
P06-021	Compound, Antigalling (PWA 550-3)
P06-036	Compound, Antigallant (PWA 36035) (Fel-Pro C-300)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Grommet	1	74-21-00	X	XX
Seal	1	74-11-00	1	55

B. Procedure

See Figure 401 and 402.

(1) Remove protective closures from exciter. Install seal (larger washer OD outboard) on exciter input (smaller) connector.

(2) Align rear exciter heat shield, with largest opening, with largest threaded connector on exciter. Engage front heat shield only far enough to line up mounting holes.

(3) Position ignition exciter, entrapped in heat shields, to mount bracket on right side of gearbox and secure in place with bolts, threads lubricated with Engine Oil (P03-001), washers, and nuts. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Check cable contacts for evidence of arcing (discoloration and heavy pitting). Check cable ends for evidence of carbon tracking. Replace cable if either condition is found. See 72-00-41, Removal/Installation-05.

(5) Install new grommets on cable ends as follows:

    (a) Clean new grommets with clean Lint Free Cotton Cloth (P05-005), and the SPOP 208 Wipe Method (Task 70-21-00-110-040).

    (b) Slide grommets on cable.

(6) Place two clamps, small clamp first, over exciter end of cable.

(7) Install ignition cable as follows:

Exciter−To−Igniter Plug Cable
Figure 402
(Task 72−00−61−450−001)

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(a) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound (P06-036) and connect the cable to the output connector on the exciter.

NOTE: When Fel-Pro C300 (PWA 36035) is not available, an alternative of Antigalling Compound (PWA 550-3) can be used.

Do not apply an excessive amount of compound to the cable coupling nut threads.

(b) Lubricate the cable coupling threads, igniter plug end, with Antiseize Compound (P06-009). Connect the cable to the plug.
(c) Torque the cable nuts until they are bottomed on their shoulders. This normally takes 140 - 160 lb-in. (15.818 - 18.078 N.m).

NOTE: Insufficient torque on the cable nut can cause ignition-radiated noise to be picked up by the aircraft radio equipment.

(8) (Reference 2151) Position heat shield segments over exciter end of cable and secure with clamps. Torque clamp screws to 15 - 18 lb-in. (1.695 - 2.034 N.m).
(9) (Reference 2151) Install heat shields at igniter plug. Bend tabs of igniter plug heat shield into groove in boss before securing clamp. Secure with clamp. Torque clamp screw to 15 - 18 lb-in. (1.695 - 2.034 N.m).
(10) Install the cable clamp to the lower cable. Attach the cable clamp to the bracket with a bolt, threads lubricated with Engine Oil (P03-001), and a nut. Torque the nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).
(11) Attach electrical cable. After engaging key to slot, secure connector by handtightening knurled coupling ring until plug is fully engaged in receptacle and coupling ring cannot be further tightened by hand.

C. Postrequisites
(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-04

Task 72-00-61-450-002:

1. Install Ignition Exciter (Upper Exciter)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-005	Cloth, Cotton Lint Free
P06-021	Compound, Antigalling (PWA 550-3)
P06-036	Compound, Antigallant (PWA 36035) (Fel-Pro C-300)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Grommet	1	74-21-00/X/XX
Seal	1	74-11-00/1/55

B. Procedure
See Figure 401 and Figure 402.

(1) Remove protective closures from exciter. Install seal (larger washer OD outboard) on exciter input (smaller) connector.

(2) Align rear exciter heat shield, with largest opening, with largest threaded connector on exciter. Engage front heat shield only far enough to line up mounting holes.

(3) Position ignition exciter, entrapped in heat shields, to mount bracket on right side of gearbox and secure in place with bolts, threads lubricated with Engine Oil P03-001, washers, and nuts. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Check cable contacts for evidence of arcing (discoloration and heavy pitting). Check cable ends for evidence of carbon tracking. Replace cable if either condition is found. See 72-00-41, Removal/Installation-04.

(5) Install new grommets on cable ends as follows:

(a) Clean new grommets with clean Lint Free Cotton Cloth P05−005, and the SPOP 208 Wipe Method (Task 70−21−00−110−040).

(b) Slide grommets on cable.

(6) Place two clamps, small clamp first, over exciter end of cable.

(7) Install ignition cable as follows:

CAUTION: INSTALL THE CABLE ENDS (LEADS) TO THE IGNITER PLUG AND THE IGNITION EXCITER BY PUSHING THE CABLE CONNECTORS IN A STRAIGHT LINE MOVEMENT. IF LATERAL FORCE IS PERMITTED, THE CABLE END CAN BE DAMAGED.

(a) Lubricate the threads of the coupling nut at the exciter end of the cable with Antigallant Compound P06−036 and connect the cable to the output connector on the exciter.

NOTE: When Antigalling Compound P06−036 is not available, an alternative of Antigalling Compound P06−021 can be used.

NOTE: Do not apply an excessive amount of compound to the cable coupling nut threads.

(b) Lubricate the cable coupling threads, igniter plug end, with Antiseize Compound P06−009. Connect the cable to the plug.

(c) Torque the cable nuts until they are bottomed on their shoulders. This normally takes 140 − 160 lb−in. (15.818 − 18.078 N.m).

NOTE: Insufficient torque on the cable nut can cause ignition−radiated noise to be picked up by the aircraft radio equipment.

(8) (Reference 2151) (Pre SB PW4ENG 73−192) Position heat shield segments over exciter end of cable and secure with clamps. Torque clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(9) (Reference 2151) (Post SB PW4ENG 73−192) Position heat shield segments over exciter end of cable. Make sure the segment half with hose fittings is pointed up. Secure with clamps. Torque clamp screws to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(10) (Post SB PW4ENG 73−192) Install cooling hoses on heat shield fittings and secure with clamps. Torque the hose clamps to 10 − 15 lb−in. (1.130 − 1.695 N.m).

NOTE: Pre SB PW4ENG 73−192 engines do not have W5/W6 wiring harness connector cooling.

(11) (Reference 2151) Install heat shields at igniter plug. Bend tabs of igniter plug heat shield into groove in boss before securing clamp. Secure with clamp. Torque clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(12) Install the cable clamp to the upper cable. Attach the cable clamp to the bracket with a bolt, threads lubricated with Engine Oil P03−001, and a nut. Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(13) Attach electrical cable. After engaging key to slot, secure connector by handtightening knurled coupling ring until plug is fully engaged in receptacle and coupling ring cannot be further tightened by hand.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-61-450-003:

1. Install Fuel Pump And Fuel Metering Unit (Package)

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85862	Adapter, Torque
PWA 85989	Fixture, Handling (Optional)
PWA 86461	Adapter, Torque

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)
R	P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	73-12-00/3/90
Packing	1	73-12-00/1/60
Packing	1	73-12-00/1/10
Packing	1	73-12-00/1/20
Packing	1	73-12-00/3/1
Packing	2	73-21-00/3/30
Packing	1	73-12-00/3/170
Retainer	1	73-12-00/3/10
Retainer	2	73-21-00/3/40

B. Procedure

See Figure 401, Figure 402 and Figure 403.

CAUTION: BE CAREFUL WHEN YOU HANDLE, REMOVE OR INSTALL ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTIONS USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

CAUTION: ENSURE ALL PROTECTIVE CLOSURES HAVE BEEN REMOVED.

R (1) Lubricate the packings with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and install to the grooves on the drive shaft and flange of the fuel pump.

R (2) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the (upper) oil cooler inlet fuel tube (FM10) flange groove.

(3) For engines not equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Pre SB PW4ENG 73-35), comply with the following.

NOTE: Items referred to as numbers in parenthesis in text are identified in Figure 403.

R (a) Install a new key washer (403/6) and coupling nut (403/4) to stopnut (403/5), threads lubricated with Engine Oil P03-001 on the oil cooler outlet fuel tube. Install the ferrule (403/3), packing (403/2), lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 and the retainer (403/1) to the tube.

R (b) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the groove in threaded three hole adapter and slip adapter on the oil cooler outlet fuel tube. Slide down the tube as far as possible.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-05

(4) For engines equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Post SB PW4ENG
R 73-35), install a packing lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the hose
R and tube assembly flange groove.

(5) Check to ensure bolts (with trapped washers) are in position on pad on right, forward side of gearbox. Lubricate bolt threads with Antiseize Paste P06-054. Wipe off unwanted paste.

NOTE: Do not install bolt to threaded hole on drive pad at 7 o'clock position.

NOTE: Bolts should be installed until threads are flush with mounting surface.

CAUTION: DO NOT ALLOW WEIGHT OF FUEL PUMP AND METERING UNIT PACKAGE TO BE TRANSMITTED TO PUMP SPLINES DURING INSTALLATION OR DAMAGE TO SPLINES MAY RESULT.

CAUTION: WHILE ROTATING ENTIRE FUEL PUMP AND METERING UNIT PACKAGE DURING INSTALLATION, ALIGN OIL COOLER INLET FUEL TUBE WITH PORT AT TOP INBOARD SIDE OF FUEL PUMP. FAILURE TO DO SO COULD RESULT IN DAMAGE TO PACKING AND/OR FUEL PUMP PORT.

(6) Position and raise the package so that the hole in the pump flange is aligned with the hole in the mounting surface. Move package rearward to engage spline and seat pump flange. Rotate package counterclockwise, aligning inlet tube, and install anti-rotation bolt, threads lubricated with Antiseize Paste P06-054, to 7 o'clock position. Wipe off unwanted paste. Use PWA 86461 Torque Adapter to torque the bolt at the 1 o'clock position and PWA 85862 Torque Adapter to torque the remaining bolts. Torque bolts on pump flange to 225 - 250 lb-in. (25.422 - 28.246 N.m).

NOTE: For ease of installation, install the PWA 85989 Handling Fixture to the fuel pump. Attach it with the two detail bolts and the hand screw.

(7) Remove the handling fixture if used.

(8) For engines not equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Pre SB PW4ENG 73-35), comply with the following.

CAUTION: STOPNUT KEY WASHER TABS MUST BE SECURELY CRIMPER OVER FACE OF STOPNUT FLANGE TO RETAIN KEY WASHER ENGAGEMENT WITH STOPNUT. IMPROPERLY SECURED KEY WASHER MAY ALLOW STOPNUT TO LOOSEN CAUSING FUEL LEAK IN ENGINE NACELLE.

(a) Slide oil cooler outlet fuel tube three hole adapter to rear port of fuel pump. Secure with three bolts, threads lubricated with Engine Oil P03-001. Bolt with lockwire holes to be installed in bottom hole. Torque bolts 85 - 95 lb-in. (9.604 - 10.734 N.m). Lubricate tube nut threads (403/4) with Engine Oil P03-001 and torque to 100 - 110 lb-in. (11.298 - 12.428 N.m), then loosen and retorque nut (403/4) to same value. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 tube nut (403/4) to bottom bolt securing adapter to pump. Handtighten stopnut (403/5) against stop and back of maximum one half turn to align with key washer. Thread engagement between both nuts must be such that No. 60 wire will not pass through 0.063 inch (1.600 mm) diameter holes (both walls) of stopnut. Crimp key washer in slots and over flange of stopnut.

(9) For engines equipped with flexible oil cooler outlet fuel hose and tube assembly (FM11) (Post SB PW4ENG 73-35), install three bolts, threads lubricated with Engine Oil P03-001, securing hose and tube assembly flange to fuel pump port. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(10) Install three bolts, threads lubricated with Engine Oil P03-001, securing oil cooler inlet fuel tube (FM10) flange to fuel pump port. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

R (11) Install the packings lubricated with Engine Oil P03-001
R or Sealing Ring Lubricant P06-053 and the retainers
R to the fuel distribution valve supply tube assembly
R (FM09). Install the tube to the adapters, threads
R lubricated with Engine Oil P03-001, on the fuel
R metering unit and to the adapter on the fuel flowmeter.
R Handtighten only.

(12) Install bolts, threads lubricated with Engine Oil P03-001, nut, and clamps securing tube to HPC case bracket and to airframe cooler oil outlet tube. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(13) Torque the (FM09) tube nuts to 100 - 110 lb-in. (11.298 - 12.428 N.m). Loosen the tube nuts and torque them again to the same limits. Safety the tube nuts with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(14) (Reference 2170) Torque tube (FM10) and (FM11) nuts to 150 - 160 lb-in. (16.948 - 18.078 N.m). Torque the tube nuts again to 150 - 160 lb-in. (16.948 - 18.078 N.m) until the torque is kept.

(15) Connect the W4P2 and the W5P1 harness connectors to the fuel metering unit harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight all the bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70-21-00-110-900). Refer to Section 70-21-00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Piers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight

- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(16) (Pre SB PW4ENG 73-84) Connect the W5P8 harness connector to the fuel temperature probe harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight all the bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70-21-00-110-900). Refer to Section 70-21-00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Piers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(17) (Post SB PW4ENG 73-84), For a thermocouple probe with a studded terminal type receptacle install the wiring harness as follows.

(a) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(b) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(c) If necessary to align the thermocouple stud box, remove the lockwire from the thermocouple coupling nut to the adapter and loosen the coupling nut.

(d) Align the thermocouple stud box with the wiring harness connector.

(e) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 - 100 lb-in. (10.734 - 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(f) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(g) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(h) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(i) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the coupling nut to the adapter.

(j) Torque the bolt that attachs the clamp and ground strap to the bracket on the housing to 36 - 40 lb-in. (4.067 - 4.519 N.m).

C. Postrequisites

(1) Install fuel bypass valve. See 72-00-61, Installation-08 (Task 72-00-61-450-005).

(2) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

(Task 72−00−61−450−003)

Task 72-00-61-450-016:

1. Install Fuel Metering Unit

A. Equipment And Materials Necessary

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-21-00/1/80
Packing	1	73-21-00/1/60
Packing	1	73-21-00/1/1
Packing	1	73-21-00/1/10
Packing	1	73-12-00/2/110
Packing	1	73-12-00/2/100
Packing	2	73-21-00/3/30
Retainer	2	73-21-00/3/40

B. Procedure
See Figure 401, Figure 402, and Figure 403.

(1) If new fuel metering unit is being installed, comply with the following:

R (a) Install a new packing lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R adapter and install the adapter and bracket to
R the fuel supply port on outboard side of metering
unit. Secure with bolts, threads lubricated with
Engine Oil P03-001. Bolt with lockwire holes to
be installed in lower outboard hole. Torque bolts
to 65 - 85 lb-in. (7.344 - 9.604 N.m).

R (b) Install a new packing lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the adapter and install the adapter, threads lubricated with Engine Oil P03-001 to inboard port on the fuel metering unit. Torque adapter to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(2) Install the transfer tubes to the fuel pump as follows:

R (a) Lubricate the two new small packings and the two new large packings with Engine Oil P03-001 or Sealing Ring Lubricant P06-053.

(b) Install two new packings to the two transfer tubes.

(c) Install the transfer tubes, packing side inward, to the fuel pump ports.

(d) Install the retainers to hold the transfer tubes in position in the fuel pump.

(e) Install the two remaining packings to the transfer tubes on fuel pump.

(3) Lubricate threads of fuel metering unit studs with Engine Oil P03-001, and install fuel metering unit to fuel pump over transfer tubes and secure with washers and nuts. Torque nuts to 275 - 300 lb-in. (31.071 - 33.895 N.m).

R (4) Install the packings lubricated with Sealing Ring Lubricant P06-053 or Engine Oil P03-001 and the retainers to the fuel distribution valve supply tube assembly (FM09). Attach the tube to the adapters, threads lubricated with Engine Oil P03-001, on the fuel metering unit and fuel flowmeter. Handtighten only.

(5) Install bolts, threads lubricated with Engine Oil P03-001, nut, and clamps securing tube to HPC case bracket and to airframe cooler oil outlet tube. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(6) Torque tube nuts to 100 - 110 lb-in. (11.298 - 12.428 N.m), loosen tube nuts, then retorque to required limit. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the tube nuts.

NOTE: Tube nut attached to fuel metering unit to be lockwired to bolt securing adapter to fuel metering unit.

(7) Lubricate threads of fuel metering unit adapter with Engine Oil P03-001. Install compressor stator cylinder manifold (CP01) to fuel bypass valve, fuel metering unit, and manifold tee. Torque manifold nut to fuel bypass valve to 200 - 225 lb-in. (22.597 - 25.422 N.m). Torque manifold nut to fuel metering unit to 450 - 500 lb-in. (50.843 - 56.492 N.m). Torque manifold nut to manifold tee to 340 - 375 lb-in. (38.415 - 42.369 N.m). Secure all nuts with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(8) Connect the W4P2 and the W5P1 harness connectors to the fuel metering unit harness receptacles as follows. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make
R straight the bent pins. If necessary, clean
R the connector and receptacle by SPOP 6 (Task
R 70-21-00-110-900). Refer to Section 70-21-00 in
R the Standard Practices Manual, PN 585005.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND

CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

(Task 72−00−61−450−016)

Task 72-00-61-450-004:

1. Install Fuel Pump To Fuel Metering Unit (On Bench)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-21-00/1/10
Packing	1	73-21-00/1/1
Packing	1	73-12-00/1/90
Packing	1	73-23-00/4/1
Packing	2	73-34-00/1/1
Packing	1	73-21-00/1/60
Packing	1	73-21-00/1/80

B. Procedure
See Figure 401.

(1) Remove protective closures from transfer tubes on pump and mating ports on fuel metering unit.

(2) If new fuel pump is being installed comply with the following:

R (a) Lubricate the packings with Engine Oil P03-001 or
R Sealing Ring Lubricant P06-053 and install the
R two packings in raised rectangular pad on the upper front side of fuel filter. Position fuel pump filter differential pressure switch to pad aligning dowel pin and secure with four bolts, threads lubricated with Engine Oil P03-001, and washers. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

R R R R (b) Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the plug and install the plug, threads lubricated with Engine Oil P03-001 to the rear upper port on the right side of the fuel pump filter housing. Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(c) For thermocouple probe with a keyway type receptacle (Pre SB PW4ENG 73-84).

R R R 1 Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the fuel temperature thermocouple probe. Install probe, threads lubricated with Engine Oil P03-001, to port on fuel pump filter housing, forward and adjacent to previously installed plug. Torque probe to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 probe and plug.

(d) For a thermocouple probe with a studed terminal type receptacle (Post SB PW4ENG 73-84).

R R R 1 Install a packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the fuel temperature thermocouple probe.

2 Lubricate the threads of the probe with Engine Oil P03-001, and install the probe to boss on the upper end of the fuel pump filter housing. .

a (Reference 2166) Remove the lockwire between the body nut and coupling nut. Loosen the coupling nut from the body nut. Torque the body nut (to the housing) to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the body nut to the filter housing.

b Turn the probe so the two larger studs are on the top and to the left as shown in the figure

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED.

c (Reference 2167) Torque the coupling to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the coupling to the body nut.

(e) (Post SB PW4ENG 73-156 and SB PW4ENG 73-161) Install the fuel temperature thermocouple probe to the fuel pump.

1 Install packing (401/10) onto plug (401/9).

2 Install the plug into the aft port in the fuel pump. Torque the plug to 110 - 120 lb-in. (12.428 - 13.558 N.m).

3 Install bushing (401/6) with bracket (401/5) into the forward port in the fuel pump. Torque the bushing (401/6) to 110 - 120 lb-in. (12.428 - 13.558 N.m).

4 Attach bracket (401/5) to plug (401/9) with bolt (401/7). Torque the bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).

5 Align the contour and bolt holes in bracket (401/3) with bracket (401/5). Attach the brackets together with two (2) screws (401/2). Torque screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

6 Install packing (401/4), lubricated with Engine Oil P03-001, onto the thermocouple probe (401/1).

7 Install the thermocouple probe (401/1) into the bracket assembly (401/3 and 401/5).

8 Rotate the thermocouple probe (401/1) so that the smaller diameter terminal studs are close to the harness and seat the thermocouple flange against the bracket assembly.

NOTE: The bolt holes in the brackets and the thermocouple flange are offset so that the thermocouple can only be attached with bolts when correctly oriented.

9 Attach the thermocouple probe to the bracket assembly with two (2) bolts (401/8). Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) If new fuel metering unit is being installed comply with the following:

R R R (a) Install a new packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the adapter and install the adapter and bracket to the fuel supply port on fuel metering unit. Secure with bolts, threads lubricated with Engine Oil P03-001. Bolt with lockwire holes to be installed in bottom outboard hole. Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m).

NOTE: Bolt with lockwire holes to be used to secure fuel tube nut at installation of package.

R R R R R (b) Install a new packing, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053, to the adapter and install the adapter, threads lubricated with Engine Oil P03-001 to the port on the fuel metering unit. Torque adapter to 200 - 225 lb-in. (22.597 - 25.422 N.m).

R R R (4) Install the packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the transfer tubes on the fuel pump.

(5) Lubricate threads of studs on fuel metering unit with Engine Oil P03-001, and aligning transfer tubes on pump with ports on metering unit, install pump to fuel metering unit and secure with washers and nuts. Torque nuts to 275 - 300 lb-in. (31.071 - 33.895 N.m).

C. Postrequisites

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−07

(1) Install fuel pump and fuel metering unit package per 72−00−61, Installation−05 Task 72−00−61−450−003.

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

Task 72−00−61−450−005:

1. Install Fuel Bypass Valve

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
R	P06−053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73−12−00/1/110
Packing	2	73−12−00/1/120
Packing	1	73−12−00/1/160
Packing	1	73−12−00/3/170

B. Procedure
See Figure 401.

(1) Remove protective closures.

(2) If new fuel bypass valve is being installed comply with the following:

R (a) Install a packing, lubricated with Engine Oil
R P03−001 or Sealing Ring Lubricant P06−053 to
R the adapter and install the adapter, threads
R lubricated with Engine Oil P03−001 to the pressure
R port on the fuel bypass valve. Torque adapter to
110 − 120 lb-in. (12.428 − 13.558 N.m).

R (3) Install a packing, lubricated with Engine Oil P03−001
R or Sealing Ring Lubricant P06−053 to the flange of oil
R cooler inlet fuel tube assembly (FM12).

R (4) Install the packings, lubricated with Engine Oil
R P03−001 or Sealing Ring Lubricant P06−053 to recesses
R on the pad on inboard side of the fuel pump. Install fuel bypass valve to fuel pump aligning bolt holes. Secure valve to pump with bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(5) Position flange of oil cooler inlet fuel tube assembly (FM12), to large opening on fuel bypass valve, (packing previously installed), and secure with bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(6) Lubricate threads of fuel metering unit adapter with Engine Oil P03−001. Install compressor stator cylinder manifold (CP01) to fuel bypass valve, fuel metering unit, and manifold tee. Torque manifold nut to fuel bypass valve to 200 − 225 lb−in. (22.597 − 25.422 N.m). Torque manifold nut to fuel metering unit to 450 − 500 lb−in. (50.843 − 56.492 N.m). Torque manifold nut to manifold tee to 340 − 375 lb−in. (38.415 − 42.369 N.m). Secure all nuts with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

Task 72-00-61-450-006:

1. Install EEC Alternator Stator (Pre SB PW4ENG 72-375)

A. Prerequisites

(1) Install EEC alternator rotor. See Installation-10 Task 72-00-61-450-007.

B. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-002	Petrolatum White (PMC 9609)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-23-00/2/1

C. Procedure

See Figure 401.

(1) Remove protective closures.

(2) Lubricate new packing (401/6) with Petrolatum White P06-002, and install on EEC alternator stator (401/8).

(3) Align boltholes in stator with boltholes on gearbox, and carefully install stator over rotor (401/10).

(4) Secure the stator to the gearbox as follows.

(a) (Pre SB PW4ENG 72-59) Attach stator and heat shield to the gearbox with three bolts (401/9) and one washer, at location shown.

(b) (Post SB PW4ENG 72-59) Attach stator to the gearbox with three bolts (401/9).

(5) Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(6) Do a check of the clearance between the stator and the EEC drive gearshaft housing mount flange. Use a 0.003 inch (0.076 mm) feeler gage. If it is possible to put the gage between the stator and the housing, the stator is not correctly installed. Do a check of the torque of the stator bolts. If the bolts are at the maximum torque and the stator is not correctly installed, remove the stator and install it again. Do the check again.

(7) Insert ends of cable in bracket on lower left side of gearbox.

- (a) With plate spacers facing bracket, secure cable ends with plate and two bolts (401/4) and (401/5).
- (b) Torque bolt (401/5) to 62 - 72 lb-in. (7.005 - 8.135 N.m).
- (c) Lubricate threads of other bolt (401/4) with Engine Oil P03-001. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) Secure cables to spring clips (401/3) and (401/2).

(9) Install clamps (401/1) to lower cable and secure to bracket below alternator with bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(10) Connect the W3P1 and the W5P6 harness connectors to the stator cable harness receptacles as follows. For each connector:

- (a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 strap wrench or the Glenair TG−69 soft−jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

D. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-09

Task 72-00-61-450-006-A:

2. Install EEC Alternator Stator (Post SB PW4ENG 72-375)

A. Prerequisites

(1) Install EEC alternator rotor (Post SB PW4ENG 72-375), See Installation-10 (Task 72-00-61-450-007-A).

B. Equipment And Materials Required

Standard Tools:
Glenair TG-70 Strap Wrench
Glenair TG-69 Soft-Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-002	Petrolatum White (PMC 9609)
P06-021	Compound, Antigalling (PWA 550)
R P06-054	Paste, Anti-Seize (PWA 36246)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-23-00/2/1
Packing	1	79-23-00/4/1

C. Procedure
See Figure 402 and Figure 403.

(1) Remove protective closures.

(2) Lubricate new packing with Petrolatum White P06-002, and install on EEC alternator stator.

(3) Align boltholes in stator with boltholes on gearbox, and carefully install stator over rotor.

(4) Attach the stator to the gearbox with three bolts, threads lubricated with Antigalling Compound P06-021, and tighten by hand.

(5) Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(6) Do a check of the clearance between the stator and the EEC drive gearshaft housing mount flange. Use a 0.003 inch (0.076 mm) feeler gage. If it is possible to put the gage between the stator and the housing, the stator is not correctly installed. Do a check of the torque of the stator bolts. If the bolts are at the maximum torque and the stator is not correctly installed, remove the stator and install it again. Do the check again.

(7) Install cable connectors to bracket on lower left side of gearbox as follows.

  (a) With plate spacers facing bracket, install the retaining plate over connector flanges. Attach the retaining plate to the bracket with two bolts.

  (b) Lubricate threads of inboard bolt with Antigalling Compound P06-021. Torque bolt to 62 - 72 lb-in. (7.005 - 8.135 N.m).

  (c) Lubricate threads of outboard bolt with Engine Oil P03-001. Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(8) Attach the cables to spring clips on a bracket on the deoiler outlet flange and to a bracket located above the IDG drive pad.

(9) Connect W5P6 and W3P1 harness connectors to the stator cable harness receptacles as follows. For each connector:

  (a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG-70 strap wrench or the Glenair TG-69 soft-jawed pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).

This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(10) Install deoiler outlet tube assembly (LB05) as follows. See Figure 403.

(a) Remove protective closures and install packing, lubricated with Engine Oil P03-001, to front flange groove of tube.

(b) Position tube and install to deoiler outlet port on rear of gearbox. Position brackets (403/1), (403/2), (403/3) over flange of tube and install
R three bolts, threads lubricated with Anti-Seize
R Paste P06-054, handtight only. Remove the
R unwanted paste.

(c) Install clamps, bolts, threads lubricated with Engine Oil P03-001, and nuts securing tube to Flanges M and N brackets. Torque clamp bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(d) Torque three bolts securing deoiler outlet tube to gearbox to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(e) Torque clamp bolt securing main filter oil tube to bracket attached to front flange of deoiler outlet tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(11) (Post SB PW4ENG 72-491) Install the deoiler idler bearing pressure line (LP35) as follows. See Figure 404.

(a) Remove protective closures from the two end nuts.

(b) Position the line to the gearbox and install the nut on the end of the line bent at 90 degrees to the deoiler (idler) spur gear adapter assembly in the gearbox.

(c) Install the nut on the straight end of the line to the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15).

(d) Torque the nut to the deoiler (idler) spur gear adapter assembly to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the nut.

(e) Torque the nut to the tee fitting in the No. 4 bearing oil pressure tube assembly (LP15) to 340 - 375 lb-in. (38.415 - 42.369 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the nut.

(f) Install clamps and bolts, threads lubricated with Engine Oil P03-001, to hold the line to the oil tank mount flange bracket and to the overboard breather pad bracket. Torque the clamp bolts to 36 - 41 lb-in. (4.067 - 4.519 N.m).

(g) Position the spray shield to the tee fitting connection and attach with the hose clamp. Torque the clamp to 15 - 18 lb-in. (1.695 - 2.034 N.m).

Task 72-00-61-450-007:

1. Install EEC Alternator Rotor (Pre SB PW4ENG 72-375)

A. Equipment And Materials Required

Special Tools:
PWA 85238 Wrench (Optional to PWA 86603)
PWA 86603 Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure
See Figure 401.

(1) Remove protective closures.

CAUTION: ENSURE ROTOR IS FULLY SEATED ON GEARSHAFT.

(2) Install EEC alternator rotor on gearshaft.

(3) Install EEC alternator rotor lock over gearshaft aligning ID flats on lock with flats on shaft and seat against rotor engaging pins on lock with holes in rotor.

CAUTION: WHEN USING THE FOLLOWING WRENCH OR ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD TORQUES, STANDARD PRACTICES MANUAL.

(4) (Reference 570) Lubricate nut with Engine Oil (P03-001), and install nut to gearshaft. Torque nut using either PWA 85238 Wrench or PWA 86603 Adapter. See Figure 402.
  - (a) Loosen both jamnuts (402/3) and retract wrench detail (402/4) from body of wrench.
  - (b) Insert handle (402/6) lug end facing outward, over mating lug of wrench detail (402/4).
  - (c) Align boltholes and position wrench body (402/2) over EEC gearshaft and onto gearshaft housing (402/1) pad.
  - (d) Engage lugs of wrench detail with mating slots in gearshaft. Secure body (402/2) with three detail screws (402/5).
  - (e) Seat wrench detail (402/4) firmly on gearshaft and secure with jamnuts (402/3).
  - (f) Engage lugs of handle (402/6) with mating lugs in nut (402/7).

Rotor Retaining Nut Installation
Figure 402
(Task 72−00−61−450−007)

(g) Torque nut to 675 - 800 lb-in. (76.265 - 90.388 N.m), loosen to 0 torque, then retorque to required limit.

NOTE: This must be done in several steps because handle movement is restricted and handle must be removed from nut and repositioned.

(h) Remove cap screws securing wrench to gearbox and remove wrench.

C. Postrequisites

(1) Install EEC alternator stator (Pre SB PW4ENG 72-375). See Installation-09 (Task 72-00-61-450-006).

Task 72-00-61-450-007-A:

2. Install EEC Alternator Rotor (Post SB PW4ENG 72-375)

A. Equipment And Materials Required

Special Tools:
PWA 86603 Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure

See Figure 402.

(1) Remove protective closures.

CAUTION: MAKE SURE THE ROTOR IS FULLY AGAINST (SEATED) THE GEARSHAFT.

DO NOT USE INDUCTION HEATING TO ASSEMBLE THE PMA ROTOR ASSEMBLY. INDUCTION HEATING CAN DAMAGE THE MAGNETIC MATERIAL IN THE ROTOR.

(2) Install the EEC alternator rotor (402/9) on gearshaft (402/8).

CAUTION: WHEN USING THE FOLLOWING ADAPTER THE ACTUAL TORQUE WRENCH READING WILL BE LESS THAN THAT STATED BELOW. SEE STANDARD TORQUES, STANDARD PRACTICES MANUAL.

(3) (Reference 570) Lubricate the nut with Engine Oil (P03−001), and install the nut to the gearshaft. Torque the nut with PWA 86603 Adapter as follows. See Figure 402.
  (a) Loosen both jamnuts (402/3). While you hold the body (402/2), loosen the wrench detail (402/4).
  (b) Install the handle (402/6), lug end facing outward, over the mating lug of wrench detail (402/4).
  (c) Align boltholes and position body (402/2) over EEC gearshaft (402/8) and onto the gearshaft housing (402/1) pad.
  (d) Engage lugs of wrench detail with mating slots in gearshaft. Attach the body (402/2) with three detail screws (402/5).
  (e) Seat the wrench detail (402/4) firmly on the gearshaft and tighten the jamnuts (402/3).
  (f) Engage the lugs of handle (402/6) with the mating lugs in the nut (402/7).
  (g) Using a standard 1/2 inch drive, torque the nut to 675 − 800 lb−in. (76.265 − 90.388 N.m), loosen to 0 torque, then torque again to 675 − 800 lb−in. (76.265 − 90.388 N.m).

NOTE: This must be done in several steps because the handle movement is limited. The handle must be removed and repositioned to nut.

  (h) Remove the screws (402/5) that attach the adapter to gearbox and remove the adapter.

C. Postrequisites
(1) Install EEC alternator stator (Post SB PW4ENG 72−375). See Installation−09 (Task 72−00−61−450−006−A).

P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	1	72-61-00	13	110

B. Procedure
See Figure 401.
(1) Lubricate new preformed packing with Engine Oil (P03-001), and position in groove of integrated drive generator (IDG) drive oil seal housing assembly.
(2) Lubricate carbon detail of face seal assembly with Engine Oil (P03-001).
(3) Install oil seal housing assembly in IDG pad over end of gearshaft to seat against flange of gear.
(4) Install retaining ring in groove in gearbox housing to secure seal assembly in place.

C. Postrequisites
(1) Service oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).
(2) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

Integrated Drive Generator Drive Oil Seal Assembly
Figure 401
(Task 72−00−61−430−004)

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-14

Task 72-00-61-430-005:

1. Install EEC Alternator Drive Oil Seal Assembly
   A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	1	72-61-00	4	80
Packing	1	72-61-00	4	140

B. Procedure
See Figure 401.
(1) Remove protective closure from EEC alternator shaft on upper rear face of gearbox.
(2) If required, install seal seat, small OD stepped face inward, over stud (threaded) end of alternator gearshaft. Install Engine Oil (P03-001), lubricated packing to groove in EEC alternator shaft. Install sleeve spacer onto shaft over above installed packing.

(3) Lubricate new preformed packing with Engine Oil (P03-001), and position in groove of alternator drive oil seal assembly.
(4) Lubricate carbon detail of seal assembly with Engine Oil (P03-001).
(5) Install oil seal assembly over stud end of gearshaft to seat against previously installed seal seat.

C. Postrequisites
(1) Install EEC alternator rotor per 72-00-61, Installation-10 (Task 72-00-61-450-007).
(2) Install EEC alternator stator per 72-00-61, Installation-09 (Task 72-00-61-450-006).
(3) Service oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).
(4) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−15

Task 72−00−61−430−006:

1. Install Fuel Pump Drive Oil Seal Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Packing	1	72−61−00	7	170

B. Procedure

See Figure 401.

- (1) Lubricate new preformed packing with Engine Oil (P03−001), and position in groove of fuel pump drive oil seal assembly.
- (2) Lubricate carbon detail of face seal assembly with Engine Oil (P03−001).
- (3) Install oil seal assembly into fuel pump drive pad over end of gearshaft to seat against shoulder on drive gear.
- (4) Secure seal assembly with retaining ring installed in groove in gearbox housing.

C. Postrequisites

- (1) Install fuel pump and fuel metering unit package per 72−00−61, Installation−05 (Task 72−00−61−450−003).
- (2) Service oil system per 72−00−00, Servicing−03 (Task 72−00−00−610−003).
- (3) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-61-430-007:

1. Install Rear Hydraulic Pump Drive Oil Seal Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	72-61-00	2	170

B. Procedure
See Figure 401.
- (1) Remove protective closure.
- (2) Lubricate new preformed packing with Engine Oil (P03-001), and position in groove of hydraulic pump drive oil seal assembly.
- (3) Lubricate carbon detail of face seal assembly with Engine Oil (P03-001).
- (4) Install oil seal assembly in hydraulic pump drive pad located over end of gearshaft to seat against shoulder on gearshaft.
- (5) Secure seal assembly in place with retaining ring.

C. Postrequisites
- (1) Service oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).
- (2) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−17

Task 72−00−61−430−008:

1. Install Front Hydraulic Pump Drive Oil Seal Assembly

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	72−61−00	14	230

B. Procedure

See Figure 401.

(1) Remove protective closure.

(2) Lubricate new preformed packing with Enigne Oil (P03−001), and position in groove of hydraulic pump drive oil seal assembly.

(3) Lubricate contact carbon detail of face seal assembly with Engine Oil (P03−001).

(4) Install oil seal assembly over end of gearshaft to seat against shoulder on gearshaft.

(5) Secure seal assembly with retaining ring.

C. Postrequisites

(1) Service oil system per 72−00−00, Servicing−03 (Task 72−00−00−610−003).

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-18

Task 72-00-61-430-009:

1. Install Starter Drive Coupling

A. Equipment And Materials Necessary

Special Tools:

PWA 26377	Holder

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-059	Lubricant, Fluorinated Grease (PWA 36230)

B. Procedure
See Figure 401.

CAUTION: BEFORE YOU APPLY FLUORINATED GREASE LUBRICANT TO THE STARTER DRIVE COUPLING, MAKE SURE THE STARTER DRIVE COUPLING SPLINES AND STARTER DRIVE GEARSHAFT SPLINES ARE CLEAN AND NOT DAMAGED. APPLY FLUORINATED GREASE LUBRICANT TO THE STARTER DRIVE COUPLING SPLINES TO REDUCE WEAR AND INCREASE SERVICE LIFE OF THE PARTS.

(1) Apply Fluorinated Grease Lubricant P06-059 to the ID and OD splines of the starter drive coupling.

(2) Carefully insert coupling into starter drive gearshaft, aligning splines.

(3) Lubricate threads of nut with Engine Oil P03-001. Secure coupling in place with flat washer and nut, fingertight.

(4) Install splined drive of PWA 26377 Holder into starter drive coupling and secure bar with two bolts to starter drive mount pad.

(5) Using standard wrench, reach into holder and torque retaining nut to 290 - 325 lb-in (32.766 - 36.720 N.m).

(6) Remove holder from starter drive mount pad.

C. Postrequisites

ENGINE GENERAL – MAIN GEARBOX – INSTALLATION–18

(1) Test engine per Test Reference Table. See 71–00–00, Testing–00 (Task 71–00–00–990–003).

Packing	1	79-21-00/9/1
Packing	1	79-21-00/9/10
Retainer	1	79-21-00/9/20

B. Procedure

See Figure 401 (Sheet 1), Figure 401 (Sheet 2), Figure 401 (Sheet 3), Figure 401 (Sheet 4), Figure 401 (Sheet 5), Figure 401 (Sheet 6), Figure 401 (Sheet 7), Figure 401 (Sheet 8), Figure 401 (Sheet 9), Figure 401 (Sheet 10), Figure 401 (Sheet 11), Figure 401 (Sheet 12), and Figure 401 (Sheet 13).

(1) (Pre SB PW4ENG 72−524) If applicable, install the details in the main oil filter housing assembly (MOFH) (401/3) as follows. See Figure 401 (Sheet 1), Figure 401 (Sheet 2), and Figure 401 (Sheet 3).

(a) Align bolt hole and position key washer (401/7) in center of cover (401/15) with tab of key washer in mating hole in cover. Secure key washer with screw (401/6), lubricated with Engine Oil P03−001. Torque screw to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Install spring (401/5) on key washer (401/7). Bend tabs of washer out between coils of spring.

(c) Install new packing (401/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (401/15).

(d) Install filter element (401/4), into opening in bottom of cover (401/15). Align bolt holes and install cover with filter element into main oil filter housing (401/3).

NOTE: Removable plug must be installed in outboard end of filter element or the filter will not properly filter the oil.

(e) Install the cover (401/15) as follows.

R
R

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING BOLTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/15) in position on the housing (401/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING BOLTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/15) with four washers (401/14) and bolts (401/13). Torque bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(2) (Post SB PW4ENG 72−524 and Pre SB PW4ENG 79−79) If applicable, install the details in the main oil filter housing assembly (MOFH) (401/3) as follows. See Figure 401 (Sheet 4) and Figure 401 (Sheet 5).

(a) Align bolt hole and position key washer (401/7) in center of cover (401/15) with tab of key washer in mating hole in cover. Secure key washer with screw (401/6), lubricated with Engine Oil P03−001. Torque screw to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(b) Install spring (401/5) on key washer (401/7). Bend tabs of washer out between coils of spring.

(c) Install new packing (401/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (401/15).

(d) Install filter element (401/4) into opening in bottom of cover (401/15). Align bolt holes and install cover with filter element into main oil filter housing (401/3).

NOTE: Removable plug must be installed in outboard end of filter element or the filter will not properly filter the oil.

(e) Install the cover (401/15) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/15) in position over the studs in the housing (401/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/15) to the housing.

1 If self−locking nuts are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/29). Lubricate the threads with Engine Oil P03−001. Torque nuts to 150 − 170 lb−in. (16.948 − 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (4012/14) and nuts (401/30). Lubricate the threads with Engine Oil P03−001. Torque nuts to 125 − 150 lb−in. (14.123 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nuts.

R
R

(3) (Post SB PW4ENG 72-524 and SB PW4ENG 79-79) If applicable, install the details in the main oil filter housing assembly (MOFH) (401/3) as follows. See Figure 401 (Sheet 6) and Figure 401 (Sheet 7).

(a) Install the spring (401/5) in the spring retainer (401/23).

(b) Install two screws (401/22) through the spring retainer screw holes and then install two washers (401/20) on the ends of the two screws.

(c) Lubricate the threads of the two screws (401/22) with Engine Oil P03-001.

(d) With the spring (401/5) in place in the spring retainer (401/23), thread the two screws (401/22) into the main oil strainer cover (401/21). Torque the two screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(e) Install new packing (401/8), lubricated with Engine Oil P03-001, into groove in OD of main oil strainer cover (401/21).

(f) Install filter element (401/4) into opening in bottom of cover (401/21). Align bolt holes and install cover with filter element into main oil filter housing (401/3).

NOTE: Removable plug must be removed from outboard end of filter element or the filter will not properly filter the oil.

(g) Install the cover (401/21) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(h) With the cover (401/21) in position over the studs in the housing (401/3), carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(i) Attach the cover (401/21) to the housing.

1 If self−locking nuts are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/29). Lubricate the threads with Engine Oil P03−001. Torque nuts to 150 − 170 lb−in. (16.948 − 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/30). Lubricate the threads with Engine Oil P03−001. Torque nuts to 125 − 150 lb−in. (14.123 − 16.948 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the nuts.

(4) Install new packing (401/9), lubricated with Engine Oil P03−001, onto insert (401/10).

(5) Install insert, lubricated with Engine Oil P03−001, into opening in bottom of cover (401/15 or 401/21, as appropriate). Torque insert to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(6) Install new packing (401/11), lubricated with Engine Oil P03−001, onto plug (401/12).

(7) Install plug (401/12), lubricated with Engine Oil P03−001, into previously installed insert (401/10). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the plug.

(8) Install packings (401/17) and (401/18), lubricated with Engine Oil P03−001, into grooves in pressure relief valve (filter element) (401/19). Install valve, threads lubricated with Engine Oil P03−001, onto port just above pressure (regulator) relief valve pad (401/16). Torque valve to 525 − 625 lb−in. (959.317 − 70.615 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the valve.

(9) (Post SB PW4ENG 72−525) If applicable, install the details in the main oil filter housing assembly (MOFH) (401/3) as follows. See Figure 401 (Sheet 8) and Figure 401 (Sheet 9).

(a) Install pressure relief valve (401/41) in center of cover (401/42) and attach with retaining ring (401/40).

(b) Install new packing (401/8), lubricated with Engine Oil P03−001, into groove in OD of main oil strainer cover (401/42).

(c) Remove the protective closure from the end of the filter element (401/39).

(d) Install the filter element (401/39) over the pressure relief valve (401/41) in cover (401/42). Align bolt holes and dowel pin in cover with studs and dowel pin hole in main oil filter housing (401/3), then install cover with filter element into main oil filter housing.

NOTE: Removable plug must be removed from outboard end of filter element or the filter will not properly filter the oil.

(e) Install the cover (401/42) as follows.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/42) in position over the studs and dowel pin hole in the housing, carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/42) with four washers (401/14) and nuts (401/29). Torque nuts to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(10) (Post SB PW4ENG 72-525) Install new packing (401/11), lubricated with Engine Oil P03-001, onto plug (401/12).

(11) (Post SB PW4ENG 72-525) Install plug (401/12), lubricated with Engine Oil P03-001, into threaded hole in bottom of cover (401/42). Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the plug.

(12) (Post PW4ENG 72-525) Install packings (401/2), lubricated with Engine Oil P03-001, onto two inserts (401/1). Install inserts, lubricated with Engine Oil P03-001, into two upper ports in main oil filter housing (401/3). Torque inserts to 200 - 225 lb-in. (22.597 - 25.422 N.m).

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−20

(13) (Post PW4ENG 72−525) Install packings (401/17) and (401/18), lubricated with Engine Oil P03−001, into grooves in plug (401/43). Install plug, threads lubricated with Engine Oil P03−001, in port just above pressure (regulator) relief valve pad (1002/16). Torque plug to 525 − 625 lb−in. (59.317 − 70.615 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the plug.

(14) Install packings (401/2), lubricated with Engine Oil P03−001, onto two inserts (401/1). Install inserts, lubricated with Engine Oil P03−001, into two upper ports (LP4 and LP5) in main oil filter housing (401/3). Torque inserts to 200 − 225 lb−in. (22.597 − 25.422 N.m).

(15) Install the oil system pressure relief valve (401/16) as follows.

- (a) Lubricate two new packings with Engine Oil P03−001.
- (b) Install the packings on the valve.
- (c) Install the valve in the bottom hole on the forward side of the MOFH.
- (d) Put the bracket on the valve.
- (e) Attach the valve and bracket to the MOFH with three bolts.
- (f) Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).
- (g) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 in the valve.

(16) Install the transfer tubes as follows. See Figure 401, (Sheet 10).

- (a) For oil filter housings that are pre SB PW4ENG 79−43, apply Engine Oil P03−001 to six packings.
- (b) For oil filter housings that are post SB PW4ENG 79−43, apply Engine Oil P03−001 to four packings.
- (c) Install the packings on the transfer tubes.

(d) Install the tubes in the holes in the front of the gearbox.

(17) For oil filter housings that are post SB PW4ENG 79-43, install the anti-siphon tube assembly as follows. See Figure 401, (Sheet 10).

(a) Find the correct position of the tube assembly as follows.

1 With no packings installed, put the eccentric flange of the tube assembly in the mating counterbore of the oil filter housing.

2 The fit of the oil filter housing and the tube assembly is correct if the tube can not turn much.

3 With the oil filter housing pointed in the installed position, see the position of the tube assembly.

4 Remove the tube assembly.

(b) Apply Engine Oil P03-001 to two packings.

(c) Install the packings on the tube assembly.

(d) Install the tube assembly in the hole in the front of the gearbox in the same position as before.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER MAIN OIL FILTER HOUSING ASSEMBLY.

CAUTION: INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79-43 AND TO SB PW4ENG 72-525).

(18) Install the oil filter housing as follows. See Figure 401, (Sheet 1).

(a) Install the oil filter housing over the transfer tubes and, if applicable, the anti-siphon tube assembly.

1 As you install the oil filter housing, turn the anti-siphon tube assembly to be in the same position as before.

R
R

2 The tube assembly must correctly seat in the mating hole of the oil filter housing.

(b) Attach the oil filter housing to the gearbox with four washers and four bolts.

(c) Do a check of the position of the anti−siphon tube assembly. The end of the tube assembly must be approximately 0.25 inch (6.350 mm) from the top of the gearbox housing.

(d) Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m).

(19) Attach the W3 and W5 wiring harnesses to the bracket on the oil filter housing as follows. See Figure 401 (Sheet 11).

(a) Lubricate the threads of a clamp bolt with Engine Oil P03−001.

(b) With the loop of the clamp up, attach the harnesses to the bracket with the clamp bolt and a nut.

(c) Torque the nut to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(20) Connect the air/oil cooler inlet tube (LP02) as follows. See Figure 401 (Sheet 1).

(a) Lubricate with Engine Oil P03−001.

1 A new packing.

2 Threads of bolts.

(b) Install the packing on the tube.

(c) Install the tube in the "oil−out" hole of the oil filter housing.

(d) Attach the tube to the oil filter housing with the bolts.

(e) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(21) Connect the oil trim pressure tube assembly (LP32) as follows. See Figure 401 (Sheet 11).

- (a) Lubricate with Antigalling Compound P06−021 the tube nut threads.
- (b) Lubricate with Engine Oil P03−001.
  - 1 A new packing.
  - 2 The threads of a clamp−bolt.
  - 3 The threads of the three other bolts.
- (c) Install the packing on the assembly.
- (d) Install the clamp−bolt in the clamp. Tighten the bolt by hand that attaches to the bracket in back of the fuel/oil cooler.
- (e) Install the assembly in the "trim" hole.
- (f) Attach the assembly to the oil filter housing with three bolts. Tighten the bolts by hand.
- (g) Torque the:
  - 1 Clamp−bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).
  - 2 Other bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).
  - 3 Tube nut to 675 − 750 lb−in. (76.265 − 84.739 N.m).
  - 4 Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(22) Install the oil cooler bypass valve drain tube assembly (LP20) as follows. See Figure 401 (Sheet 11).

- (a) Lubricate with Engine Oil P03−001.
  - 1 Two new packings.
  - 2 The threads of two bolts.
  - 3 The threads of the tube nut.

(b) Install a packing at both ends of the tube.

(c) Install a retainer on the tube at the end with the flange.

(d) Install the tube in the "servo" hole of the oil filter housing.

(e) Attach the tube to the oil filter housing with two bolts. Tighten the bolts by hand.

(f) Attach the tube nut to the oil cooler bypass valve. Tighten the tube by hand.

(g) Torque the:

1 Bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

2 Tube the nut to 65 − 70 lb−in. (7.344 − 7.909 N.m). Loosen the tube nut and torque it again to 65 − 70 lb−in. (7.344 − 7.909 N.m).

(h) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 in the tube nut.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(23) Install the main filter oil tube (LP01)as follows. See Figure 401 (Sheet 12) and Figure 401 (Sheet 13).

R R (a) Lubricate with Antiseize Paste P06−054. Wipe off unwanted paste.

1 The threads of two bolts (for the rear end of the tube).

(b) Lubricate with Engine Oil P03−001.

1 Two new packings.

2 The threads of eight other bolts.

(c) Install a packing on each end of the tube.

(d) Install one end of the tube in the "oil-in" hole in the oil filter housing.

(e) Install the other end of the tube in the top of the lubrication and scavenge oil pump.

(f) Attach the front end of the tube to the oil filter housing with three bolts. Tighten by hand.

(g) Attach the rear end of the tube and a bracket to the oil pump with two bolts. Tighten by hand.

(h) Attach the tube to brackets on the gearbox with clamp bolts and nuts. Tighten by hand.

(i) Attach the tube to the bracket on the diffuser case with a clamp bolt and nut. Tighten by hand.

(j) Attach the tube to the clamps on the adjacent (LR05) tube just above the oil pump with clamp bolts and nuts. Tighten by hand.

NOTE: Be sure the clip-on loop clamp grommets are on the (LP01) tube at three clamp locations and on the (LR05) tube assembly at two locations (Post SB PW4ENG 79-36 and Post SB PW4ENG 79-46). See clamp views.

(k) Torque:

1 The nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

2 The bolts in the oil filter housing to 85 - 95 lb-in. (9.604 - 10.734 N.m).

3 The bolts in the oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

C. Postrequisites

(1) Service the oil system. Refer to 72-00-00, Servicing-03 Task 72-00-00-610-003.

(2) Test the engine. Refer to the Test Reference Table, 71-00-00, Testing-00 Task 71-00-00-990-003.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-21

Task 72-00-61-430-021:

1. Install IDG Drive Gearshaft Plug And Bolt

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	72-61-00	17	160
Packing	1	72-61-00	17	100
Packing	1	72-61-00	17	130

B. Procedure

See Figure 401.

(1) For those engines not utilizing an IDG, install the IDG drive bolt, plug and cover.

  (a) Install packing (401/9), lubricated with Engine Oil (P03-001), in groove of bolt (401/10), lubricated with Engine Oil (P03-001), nearest bolt head. Install bolt and packing assembly in IDG drive gearshaft, seating bolthead in groove in gearshaft internal splines.

  (b) Install packing (401/8), lubricated with Engine Oil (P03-001), in groove of plug (401/7), lubricated with Engine Oil (P03-001). Install plug over bolt, plugging gearshaft opening.

  (c) Install washer (401/6) and nut (401/5), lubricated with Engine Oil (P03-001), over bolt. Torque nut to 85 - 95 lb-in. (9.604 - 10.734 N.m).

  (d) Install gasket (401/4) and cover (401/3) and secure with eight washers (401/2) and eight bolts (401/1). Torque bolts to 225 - 250 lb-in. (25.422 - 28.246 N.m).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-22

Task 72-00-61-430-012:

1. Install Rear Hydraulic Pump Drive Plug And Bolt
   A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Gasket	1	72-61-00	17	60
Packing	1	72-61-00	17	1
Packing	1	72-61-00	17	30

B. Procedure
See Figure 401.

(1) For those engines not utilizing a rear hydraulic pump, install the rear hydraulic pump drive bolt, plug and cover.
  - (a) Install packing (401/8), lubricated with Engine Oil (P03-001), in groove of bolt (401/9), lubricated with Engine Oil (P03-001), nearest bolt head. Install bolt and packing assembly in rear hydraulic pump drive gearshaft, seating bolthead in groove in gearshaft internal splines.
  - (b) Install packing (401/7), lubricated with Engine Oil (P03-001), in groove of plug (401/6), lubricated with Engine Oil (P03-001). Install plug over bolt, plugging gearshaft opening.
  - (c) Install washer (401/5) and nut (401/4), lubricated with Engine Oil (P03-001), over bolt. Torque nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).
  - (d) Install gasket (401/3) and cover (401/2) over studs on drive pad. Secure with four hydraulic pump nuts (401/1) lubricated with Engine Oil (P03-001). Torque nuts to 275 - 300 lb-in. (31.071 - 33.895 N.m).

Task 72-00-61-430-013:

1. Install Front Hydraulic Pump Drive Gearshaft Plug And Bolt

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Gasket	1	72-61-00	17	60
Packing	1	72-61-00	17	1
Packing	1	72-61-00	17	30

B. Procedure

See Figure 401.

(1) For those engines not utilizing a front hydraulic pump, install the front hydraulic pump drive bolt, plug and cover.

  (a) Install packing (401/8), lubricated with Engine Oil (P03-001), in groove of bolt (401/9), lubricated with Engine Oil (P03-001), nearest bolt head. Install bolt and packing assembly in front hydraulic pump drive gearshaft, seating bolthead in groove in gearshaft internal splines.

  (b) Install packing (401/7), lubricated with Engine Oil (P03-001), in groove of plug (401/6), lubricated with Engine Oil (P03-001). Install plug over bolt, plugging gearshaft opening.

  (c) Install washer (401/5) and nut (401/4), lubricated with Engine Oil (P03-001), over bolt. Torque nut to 36 - 40 lb-in. (4.067 - 4.519 N.m).

  (d) Install gasket (401/3) and cover (401/2) over studs on drive pad. Secure with four hydraulic pump nuts (401/1) lubricated with Engine Oil (P03-001). Torque nuts to 275 - 300 lb-in. (31.071 - 33.895 N.m).

Bolt And Cover Installation
Figure 401
(Task 72−00−61−430−013)

Task 72-00-61-460-001:

1. Install Fuel Pump Filter

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-005	Lint Free Cotton Cloth
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
R R	P06-053	Lubricant, Sealing Ring (PWA 36500)
	P11-004	Solvent, Cleaning (PMC 9010)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Fuel Filter Element	1	73-12-00/2/10
Packing	1	73-12-00/2/20
Packing, (TRW)	1	73-12-00/2/60

B. Procedure
See Figure 401.

CAUTION: REPLACE THE USED FUEL FILTER ELEMENT WITH A NEW FUEL FILTER ELEMENT. DO NOT CLEAN OR USE THE SAME FUEL FILTER ELEMENT AGAIN. INSTALL THE CORRECT FUEL FILTER ELEMENT FOR THE ENGINE MODEL. LOOK AT THE ELEMENT TO FIND THE PART NUMBER AND ENGINE MODEL MARKS. IF THE ELEMENT IS INCORRECT FOR THE ENGINE MODEL, THIS CAN CAUSE CONTAMINATION OF THE FUEL SYSTEM AND UNSATISFACTORY ENGINE OPERATION.

(1) Remove protection covers and clean the cover and filter cavity with a lint free Cotton Cloth P05-005. Examine the heli-coil insert(s). If the insert(s) are not recessed in the housing, you must replace the pump.

CAUTION: IT IS POSSIBLE THAT THE OLD GASKETS FROM THE REMOVED FILTER ELEMENT CAN BE STUCK INSIDE THE FUEL FILTER HOUSING CAVITY OR COVER. BE SURE YOU EXAMINE THE FILTER CAVITY AND COVER. REMOVE THE OLD FILTER GASKETS FROM THE CAVITY AND COVER IF NECESSARY OR DAMAGE TO THE ENGINE CAN RESULT.

(2) Examine the filter housing cavity and the filter cover. Be sure that the old gaskets from the removed filter element are not stuck in the cavity or the cover. Remove the old gaskets if necessary.

R (3) Install a new packing, lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the cover.

CAUTION: YOU MUST ADHERE (KEEP) TO THE FOLLOWING TORQUING PROCEDURE TO PREVENT DAMAGE TO THE PACKING AND HELI-COIL INSERTS, AND THE FILTER COVER FROM COCKING (NOT ALIGNED). BE SURE YOU TIGHTEN THE COVER NUTS EVENLY. MONITOR THE COVER INSTALLATION AND BE SURE THE COVER ENGAGES THE HOUSING EVENLY AND FREELY. DO NOT OVERTORQUE THE NUTS OR BOLT.

(4) For fuel pumps with the five cover bolts, washers, and no nuts (Pre SB PW4ENG 73-75), install the filter as follows.

(a) Do not use any lubricant on the threads of bolts. Clean the threads of bolts with a Cleaning Solvent P11-004 and dry before installation of bolts. Install the new filter element onto the filter cover and then into the fuel pump cavity. Attach with the bolts (dry), and washers. Engage evenly the filter cover by tightening evenly the bolts, and monitor the 'Run On' torque required to turn each bolt through the inserts before the last torque. Torque the bolts to 150 - 170 lb-in. (16.948 - 19.207 N.m) plus the torque required to turn the bolts through the heli-coil inserts. If you must replace the coil inserts, but the inserts are not available, you can use alternate bolts (and lockwire) that are in the Illustrated Parts List of the Component Maintenance Manual. Tighten the filter cover by tightening the alternate bolts using the above torquing procedure. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the bolts.

(5) For fuel pumps with the four nuts, washers, dee-bolts, and the torque-limiting bolt (Post SB PW4ENG 73-75) and (Pre SB PW4ENG 73-104), install the filter as follows.

CAUTION: BE SURE YOU TIGHTEN THE COVER NUTS EVENLY. DO NOT USE THE TORQUE-LIMITING BOLT TO ENGAGE THE COVER TO THE HOUSING. MONITOR THE COVER INSTALLATION AND BE SURE THE COVER ENGAGES THE HOUSING EVENLY AND FREELY. DO NOT OVERTORQUE THE NUTS OR BOLT.

(a) Do not use any lubricant on the threads of bolts. Clean the threads of the bolts with a Cleaning Solvent P11-004 and dry before installation of bolts. Install the new filter element onto the filter cover and then into the fuel pump cavity. Attach with the four dee-bolts, washers, and nuts. Install the torque-limiting bolt and washer. Do not use the torque-limiting bolt to engage the cover to the pump. Engage evenly the filter cover by tightening evenly the nuts. Monitor the 'Run On' torque needed to turn the nuts through the self-locking feature. After the cover is completely engaged, loosen and torque the four nuts (one at a time) to 150 - 170 lb-in. (16.948 - 19.207 N.m) plus the 'Run On' torque. Tighten and torque the torque-limiting bolt to 150 - 170 lb-in. (16.948 - 19.207 N.m) plus the 'Run On' torque.

(6) For fuel pumps with the five nuts, washers, and the four dee-bolts (Post SB PW4ENG 73-104), install the filter as follows.

CAUTION: BE SURE YOU TIGHTEN THE COVER NUTS EVENLY TO ENGAGE THE COVER TO THE HOUSING. MONITOR THE COVER INSTALLATION AND BE SURE THE COVER ENGAGES THE HOUSING EVENLY AND FREELY. DO NOT OVERTORQUE THE NUTS.

(a) Do not use any lubricant on the threads of bolts. Clean the threads of the bolts with a Cleaning Solvent P11-004 and dry before installation of bolts. Install the new filter element onto the filter cover and then into the fuel pump cavity. Attach with the four dee-bolts, washers, and nuts. Engage evenly the filter cover by tightening evenly the nuts. Monitor the 'Run On' torque needed to turn the nuts through the self-locking feature. After the cover is completely engaged, loosen and torque the five nuts (one at a time) to 150 - 170 lb-in. (16.948 - 19.207 N.m) plus the 'Run On' torque.

R (7) Install a packing, lubricated with Engine Oil P03-001
R or Sealing Ring Lubricant P06-053 to the plug. Install plug, threads lubricated with Engine Oil P03-001, to center opening on filter cover. Torque plug to 45 - 55 lb-in. (5.084 - 6.214 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the plug.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Fuel Pump Filter
Figure 401
(Task 72−00−61−460−001)

Task 72-00-61-450-009:

1. Install Fuel Pump Filter Differential Pressure Switch

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
R P06-053	Lubricant, Sealing Ring (PWA 36500) R

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	73-34-00/1/1

B. Procedure

See Figure 401.

(1) Remove protective closures.

R (2) Use the two new packings lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053. Position the differential pressure switch on the fuel pump and align the dowel pin. R R R

(3) Secure switch and bracket for (Post SB PW4ENG 73-84 engine only) with bolts, threads lubricated with Engine Oil P03-001, and washers. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(4) Connect electrical connector. Tighten handtight.

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 Task 71-00-00-990-003.

Fuel Pump Filter Differential Pressure Switch
Figure 401
(Task 72−00−61−450−009)

Task 72-00-61-450-010:

1. Install EEC Fuel Temperature Thermocouple Probe

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-23-00/4/1

B. Procedure
See Figure 401 and Figure 402.

(1) Remove protective closure.

(2) For thermocouple probe with a keyway type receptacle (Pre SB PW4ENG 73-84). Install probe as follows:

R (a) Install a packing lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R EEC fuel temperature thermocouple probe.

(b) Lubricate threads of probe with Engine Oil P03-001, and install probe to boss on upper end of fuel pump filter housing. Torque probe to 110 - 120 lb-in. (12.428 - 13.558 N.m). Lockwire probe.

(c) Connect the W5P8 harness connector to the probe harness receptacle as follows.

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70-21-00-110-900). Refer to
R Section 70-21-00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG-70 Strap Wrench or the Glenair TG-69 Soft-Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(3) (Post SB PW4ENG 73-84), Install the EEC fuel temperature thermocouple probe and wiring harness connector as follows.

R (a) Install a packing lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R adapter.

(b) (Reference 2166) remove protection covers and install the concave end of the adapter into the port of the housing. Torque the adapter to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the adapter to the housing.

(c) Lubricate the threads of the thermocouple probe with Engine Oil P03-001, and install the probe into the adapter in the fuel pump filter housing.

(d) Turn the thermocouple probe to align the thermocouple studs with the terminal on the wiring harness.

NOTE: Do not install the clamp, ground strap, and bolt to the bracket on the housing at this time.

CAUTION: DO NOT LUBRICATE THREADS ON THERMOCOUPLE WIRING HARNESS CONNECTIONS (TERMINAL STUDS). LUBRICATION OF THREADS ON THE THERMOCOUPLE COULD CAUSE MALFUNCTION OF THE THERMOCOUPLE.

(e) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(f) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED

(g) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 - 100 lb-in. (10.734 - 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(h) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(i) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(j) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(k) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 from the coupling nut to the adapter.

(l) Torque the bolt that attaches the clamp and ground strap to the bracket on the housing to 36 − 40 lb−in. (4.067 − 4.519 N.m).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-61-450-011:

1. Install EEC Oil Temperature Thermocouple Probe

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	73-23-00/4/10

B. Procedure
See Figure 401 and Figure 402.

(1) Remove protective closure.

(2) For thermocouple probe with a keyway type receptacle (Pre SB PW4ENG 73-84). Install probe as follows:

R (a) Install a packing lubricated with Engine Oil
R P03-001 or Sealing Ring Lubricant P06-053 to the
R EEC oil temperature thermocouple probe.

(b) Lubricate threads of probe with Engine Oil P03-001, and install probe to boss located on lower, left side of main gearbox front face. Torque probe to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the probe.

(c) Connect the W3P18 harness connector to the probe harness receptacle as follows:

1 Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary,
R carefully make straight all the bent pins. If
R necessary, clean the connector and receptacle
R by SPOP 6 (Task 70−21−00−110−900). Refer to
R Section 70−21−00 in the Standard Practices
R Manual, PN 585005.

2 Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

3 Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(3) (Post SB PW4ENG 73-84), Install the EEC oil temperature thermocouple probe and wiring harness connector as follows.

R (a) Install a packing lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the adapter.

(b) (Reference 571) remove protection covers and install the concave end of the adapter into the port of the gearbox housing. Torque the adapter to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install lockwire from the adapter to the housing.

(c) Lubricate the threads of the thermocouple probe with Engine Oil P03-001, and install the probe into the adapter in the gearbox housing.

(d) Turn the thermocouple probe to align the thermocouple studs with the terminal on the wiring harness.

NOTE: Do not install the clamp, ground strap, and bolt to the main gearbox pressure tube (LP12) at this time.

(e) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(f) Install the clamp, ground strap, and bolt loosely to the main gearbox pressure tube (LP12).

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(g) (Reference 572) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 - 100 lb-in. (10.734 - 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(h) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(i) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 - 22 lb-in. (2.034 - 2.486 N.m).

(j) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 - 18 lb-in. (1.695 - 2.034 N.m).

(k) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the coupling nut to the adapter.

(l) Torque the bolt that attachs the clamp and ground strap to the main gearbox pressure tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

C. Postrequisites

(1) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

Task 72-00-61-450-012:

1. Install The Lube Oil Tank Assembly

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-61-00/15/1
Packing	1	72-61-00/15/30
Packing	1	79-11-00/1/20
Packing	1	79-11-00/1/40
*Packing	1	79-11-00/2/100
*Packing	1	79-11-00/2/105A
*Packing	1	79-11-00/3/10
*Packing	1	79-11-00/4/1
*Packing	1	79-11-00/4/60
*Packing	1	79-11-00/4/80

*NOTE: These parts are not necessary if you install the same tank you removed.

B. Procedure

(1) Remove the covers that protect the oil tank holes.

(2) If not installed, install the oil tank cap (401/1) and related parts. This procedure is for an oil tank without a remote filler or (Post SB PW4ENG 79-47). See Figure 401.

(a) Align the oil tank sump (401/7) on the oil tank boss.

(b) Install the filler neck valve (401/5):

1 Look under the valve of the filler neck valve. If there is no packing (401/8) there, install one that is lubricated with Engine Oil P03−001.

2 Apply Engine Oil P03−001 to a packing (401/6) and the threads of six bolts (401/4).

3 Put one of the bolts in the hole of the oil tank cap lanyard (401/3).

4 Attach the filler neck valve and the oil tank sump to the oil tank with the six bolts. Torque the bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(c) Install the oil tank cap (401/1):

1 Apply Engine Oil P03−001 to a packing (401/2). Install the packing on the oil tank cap.

2 Put the cap in the filler neck valve. Turn the cap clockwise to CLOSE.

(3) If not installed, install the oil tank cap (402/1) and related parts. This procedure is for an oil tank with a remote filler or (Pre SB PW4ENG 79−47). See Figure 402.

(a) Install the connector (remote filler) (402/9):

1 Apply Engine Oil P03−001 to a packing (402/13) and the the threads of four bolts (402/12).

2 Install the packing on the connector.

3 Attach the connector to the oil tank with the four bolts. Torque the bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

4 If applicable, install the plugs (402/11 and 402/15):

a Apply Engine Oil P03−001 to two packings (402/10 and 402/14) and the threads of the two plugs.

b Put the packings on the plugs.

c Install the plugs. Torque plug (402/11) to 200 − 225 lb−in. (22.597 − 25.422 N.m). Torque plug (402/15) to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(b) Install the filler neck valve (402/3):

1 Align the oil tank sump (402/8) on the connector.

2 Apply Engine Oil P03−001 to a packing (402/6) and the threads of two bolts (402/7) and four bolts (402/4).

3 Install the packing on the filler neck valve.

4 Put one of the bolts in the hole of the oil tank cap lanyard (402/5).

5 Attach the filler neck valve, oil tank sump, and connector to the oil tank with the two long bolts at Locations C.

6 Attach the filler neck valve and oil tank sump to the connector with the four short bolts and nuts (402/16) at Locations B.

7 Torque the short bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

8 Torque the long bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(4) Install the oil tank heat shield (403/1) as follows. See Figure 403.

(a) Align the raised seam of the heat shield with the seam on the oil tank.

(b) Apply Engine Oil P03−001 to the clamp screw.

(c) (Reference 2151) Attach the heat shield with the clamp (403/6). Torque the clamp screw to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(5) Install the packings on the gearbox−oil tank mating parts. See Figure 404.

(a) Apply Engine Oil P03−001 to packings (404/2), (404/3), (404/4), and (404/5).

(b) Install packing (404/4) on the front mating flange of the oil tank.

(c) Install packing (404/2) on the oil tank breather tube.

(d) Install packing (404/5) on the gearbox transfer tube.

(e) Install packing (404/3) on the gearbox oil check valve housing.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER LUBE OIL TANK. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 79−43.

(6) Install the oil tank on the gearbox. See Figure 403.

(a) Apply Engine Oil P03−001 to the threads of bolts (403/2).

(b) Align the offset boltholes on the oil tank and gearbox.

(c) Attach the bracket (Pre SB PW4ENG 79−48) (403/3), heat shield (403/1), bracket (Post SB PW4ENG 72−491) (403/7) and oil tank with five of the bolts.

(d) Attach the bracket (403/5) with the identification plate with two of the bolts.

(e) Attach the oil tank and ground−strap (403/4) to the gearbox at any position with one of the bolts.

(f) Install the remaining bolts.

CAUTION: MAKE SURE THAT THE TUBES IN THE OIL TANK CORRECTLY ENGAGE THE TUBES FROM THE GEARBOX. INCORRECT ENGAGEMENT OF THE TUBES CAN CAUSE AN IN-FLIGHT SHUTDOWN.

(g) Make sure that the oil tank is correctly installed as follows.

1 Look in the hole at the top of the oil tank.

2 With a mirror, do a check to be sure that the tubes inside the oil tank are engaged with the tubes from the main gearbox. Give special attention to the engagement of the breather tube (404/1) with its mating tube.

(h) Torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(i) Install packing (403/10), lubricated with Engine Oil P03-001, onto the groove in cover (403/9) and install the cover to the flange of the hole at the top of the oil tank.

(j) (Pre SB PW4ENG 79-74) Attach the cover (403/10) to the tank flange with six (6) bolts (403/8) and nuts (403/11). Torque nuts to 30 - 35 lb-in. (3.390 - 3.954 N.m).

(k) (Post SB PW4ENG 79-74) Install the oil tank heat shield bracket (403/12) to the bottom of the flange at the top of the oil tank. Attach the cover (403/9) and bracket (403/12) to the tank flange with six (6) bolts (403/8) and nuts (403/11). Torque nuts to 30 - 35 lb-in. (3.390 - 3.954 N.m).

C. Postrequisites

(1) Install the oil tank magnetic chip detector assembly. Refer to Installation-36 (Task 72-00-61-450-017).

(2) Install the oil tank sight gage. Refer to Installation-31 (Task 72-00-61-450-013).

(3) Install the (lower left) turbine vane cooling air tube (AP03). Refer to 72-00-52, Installation-07 (Task 72-00-52-450-004).

(4) Service the oil system. Refer to 72−00−00, Servicing−03 (Task 72−00−00−610−003).

(5) Test the engine. Use the Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Figure 404
(Task 72−00−61−450−012)

Task 72-00-61-430-014:

1. Install Pressure (Regulator) Relief Valve

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	79-21-00/2/50
Packing	1	79-21-00/2/60
Packing	1	79-21-00/2/80
Packing	1	79-21-00/2/110

B. Procedure

See Figure 401.

(1) Lubricate packings (401/7) and (401/8) with Engine Oil P03-001, and install packings in two grooves on valve housing (401/6).

(2) Install valve housing (401/6) in port on main oil filter housing. Install bracket (401/10) on valve housing. Secure bracket and valve housing to filter housing with three bolts (401/9) lubricated with
R Antiseize Paste P06-054. Wipe off unwanted paste. Torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

(3) Secure W3 and W5 wiring harnesses to inboard side of bracket with clamp (loop up) (401/5), bolt (head outward) (401/9), lubricated with Engine Oil P03-001 and nut (401/6). Torque bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(4) Install the new packing (401/5), lubricated with Engine Oil P03-001, to the pressure relief valve (401/4).

(5) Install the valve (401/4) to the housing (401/6) with the packing end in first.

(6) Install the new packing (401/2) lubricated with Engine Oil P03-001, to the relief valve plug (401/1).

(7) Install the spring (401/3) to the plug (401/1) and install both into the housing (401/6).

(8) Torque the plug to 650 - 750 lb-in. (73.440 - 84.738 N.m).

(9) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

C. Postrequisites

(1) Service oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).

(2) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-30

Task 72-00-61-430-015:

1. Install Pressure Relief Valve (Filter Element) (Pre SB PW4ENG 72-525)

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-21-00	2	20
Packing	1	79-21-00	2	30

B. Procedure

See Figure 401.

NOTE: A dual element oil filter is introduced by SB PW4ENG 72-525 which also replaces the pressure relief valve in the main oil filter housing with a plug. For Post SB PW4ENG 72-525 installation of the pressure relief valve and the replacement plug, see 72-00-61, Install-20 or 72-61-00, Assembly-04.

(1) Install new packings lubricated with Engine Oil (P03-001), in grooves of pressure relief valve.

(2) Lubricate threads of valve with Engine Oil (P03-001), and install pressure relief valve in main oil filter housing. Torque valve to 525 - 625 lb-in. (59.317 - 70.616 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).

C. Postrequisites

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−30

(1) Service oil system per 72−00−00, Servicing−03 (Task 72−00−00−610−003).

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

Task 72-00-61-450-013:

1. Install The Oil Tank Sight Gage

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-11-00	2	60

B. Procedure

See Figure 401.

(1) Remove the cover from the hole.

(2) Apply Engine Oil (P03-001) to a packing (401/3) and two bolts (401/1).

(3) Install the packing on the sight gage.

(4) Attach the sight gage to the oil tank with the two bolts. Torque bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Install the Lockwire (P05-289) or Safety Cable (P05-291) and Safety Cable Ferrule (P05-292).

Task 72-00-61-450-014:

1. Install Lubrication And Scavenge Oil Pump

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
R P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	79-21-00/1/30
Packing	2	79-21-00/1/40
Packing	2	79-21-00/1/60
Packing	1	79-21-00/7/1
Packing	1	79-22-00/3/1
Packing	1	79-22-00/4/1
Packing	1	79-22-00/1/1
Packing	1	79-22-00/2/1

B. Procedure
See Figure 401 and Figure 402.

(1) Lubricate preformed packings with Engine Oil P03-001, and install packings in grooves of ferrules on tubes as follows.

(a) (Pre SB PW4ENG 79-75) Install packing to main filter oil tube assembly (LP01). See Figure 401.

(b) (Post SB PW4ENG 79-75) Install packing to main filter oil tube assembly (LP01) and the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86). See Figure 402.

(c) Install packing to No. 3 bearing oil scavenge manifold assembly (LR04).

(d) Install packing to No. 4 bearing oil scavenge tube assembly (LR05).

(e) Install packing to angle gearbox oil scavenge tube assembly (LR01).

(f) Install packing to main bearing oil scavenge tube assembly (LR03).

1 (Post SB PW4ENG 79-58) Install a strainer element into the No. 1, 1.5 and 2 bearing oil scavenge tube assembly (LR03).

(2) Lubricate preformed packings with Engine Oil P03-001, and install packings to grooves on left transfer tube. Install tube in oil pump.

(3) Lubricate preformed packings with Engine Oil P03-001, and install packings to grooves on right transfer tube. Install tube in oil pump.

(4) Lubricate preformed packings with Engine Oil P03-001, and install packings to groove on oil pump.

(5) Install lubrication and scavenge oil pump to gearbox aligning transfer tubes with their respective ports. Secure oil pump with washers and bolts, threads
R lubricated with Antiseize Paste P06-054. Wipe off
R unwanted paste. Torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(6) (Pre SB PW4ENG 79-75) Attach main filter oil tube assembly (LP01) with packing (previously installed) and bracket to top rear port of oil pump with bolts,
R threads lubricated with Antiseize Paste P06-054. Wipe
R off unwanted paste. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m). See Figure 401.

(7) (Pre SB PW4ENG 79-75) Tighten and torque clamp bolt on main filter oil tube bracket to 36 - 40 lb-in. (4.067 - 4.519 N.m). See Figure 401.

CAUTION: BE CAREFUL WHEN YOU HANDLE ALL TUBES WHICH CONTAIN A FLEX DESIGN SEGMENT. REMOVE AND INSTALL A TUBE WITH A FLEX SEGMENT WITH THE SAME PRECAUTION USED FOR A TUBE WITHOUT A FLEX SEGMENT. DO NOT BEND THE FLEXHOSE OF A TUBE TO HELP WITH THE INSTALLATION OR REMOVAL OF THE TUBE OR AN ATTACHED COMPONENT. IF A FLEX SEGMENT IS BENT TOO MUCH, THIS CAN CAUSE A KINK IN THE EXTERNAL WIRE BRAID AND IN THE INNER POLYTETRAFLUOROETHYLENE (PTFE) TUBE AND LEAKS OR TUBE RUPTURE CAN BE THE RESULT.

(8) (Post SB PW4ENG 79-75) Attach the fluid pressure dampener or the fluid pressure adapter assembly (Post SB PW4ENG 79-86) and the main oil filter hose and tube assembly (LP01) with packing (previously installed). See Figure 402.

(a) If applicable, install the dampener or adapter to the top of the main oil pump and hold with bolts, threads lubricated with Engine Oil P03-003, to a handtight condition only.

(b) Attach the tube (LP01) to the dampener or adapter, threads lubricated with Engine Oil P03-003, to a handtight condition only.

(c) Install bolts, threads lubricated with Engine Oil P03-003, nuts and clamps securing tube to gearbox brackets, handtight only.

(d) Install bolts, threads lubricated with Engine Oil P03-003, on the tube (LP01) which attaches to the diffuser case bracket.

(e) Torque all the clamp bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m).

(f) Torque the bolts that hold the dampener or adapter to top of the main oil pump to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(g) Torque the bolts that hold the tube (LP01) to the dampener or adapter to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(h) Torque the bolts securing the tube (LP01) to the diffuser case bracket to 65 - 75 lb-in. (7.344 - 8.474 N.m).

(9) (Post SB PW4ENG 79-75) If applicable, install the loop clamp bracket assembly on the fluid pressure dampener or adapter as follows. See Figure 402.

(a) Secure the bracket assembly to the dampener or adapter with bolts and nuts to a handtight condition only.

(b) Torque the bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m)

(10) Starting at right rear of oil pump and working forward, attach four scavenge tubes (with packings previously installed) with bolts, threads lubricated with
R Antiseize Paste P06-054, as follows. Wipe off unwanted
R paste.

(a) Attach No. 3 bearing oil scavenge manifold assembly (LR04).

NOTE: The No. 3 bearing oil scavenge manifold assembly contains a strainer element (Post SB PW4ENG 79-58) on the scavenge pump side of the manifold.

(b) Attach No. 4 bearing oil scavenge tube assembly (LR05).

(c) Attach angle gearbox oil scavenge tube assembly (LR01).

(d) Attach main bearing oil scavenge tube assembly (LR03).

(11) Torque all bolts securing four scavenge tubes to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(12) Torque all clamp bolts loosened to allow disengagement of tubes to 36 - 40 lb-in. (4.067 - 4.519 N.m).

C. Postrequisites

(1) Install the magnetic chip detector assemblies in the oil tank and main gearbox. Refer to Installation-36 (Task 72-00-61-450-017).

(2) Service oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).

ENGINE GENERAL − MAIN GEARBOX − INSTALLATION−32

(3) Test engine per Test Reference Table. See 71−00−00, Testing−00 (Task 71−00−00−990−003).

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-33

Task 72-00-61-420-003:

1. Install Main Gearbox

NOTE: See Figure 401 for part/assembly installation sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-00-61-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:
PWA 85241 Arm, Lifting
PWA 85123 Fixture, Handling (Optional to PWA 86056)
PWA 85768 Puller
PWA 86056 Fixture, Handling

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

		PARTS CATALOG REFERENCE		
PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Cotter Pin	1	72-00-61	1	20
Cotter Pin	2	72-00-61	1	100

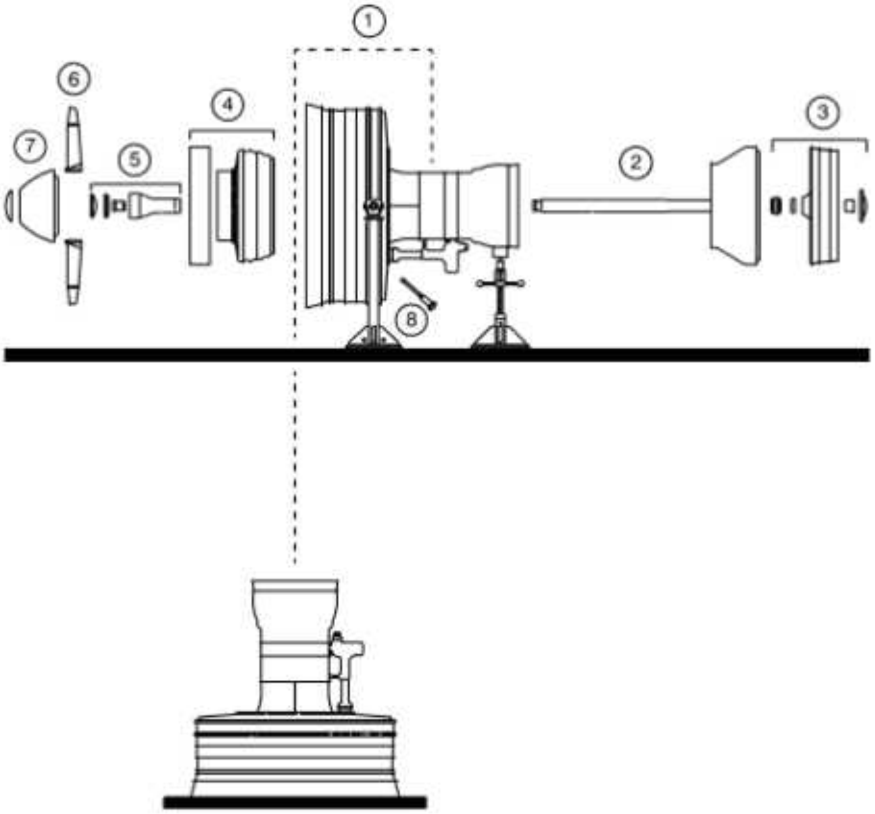
Washer	2	72-00-61	1	70
Washer	2	72-00-61	1	130

Lockwire, AS3214-02

C. Procedure

(1) Position nylon sling through gearbox outer support lugs, located on top of gearbox on left and right sides and attach hoist.

(2) Place PWA 86056 or PWA 85123 Fixture on workbench.



1. TRUNNION FAN CASES THROUGH HPT FROM HORIZONTAL TO FRONT END DOWN
2. INSTALL LPT GROUP WITH SHAFT
3. INSTALL TURBINE EXHAUST CASE GROUP
4. INSTALL LPC GROUP
5. INSTALL FAN/LPT COUPLING ASSEMBLY
6. INSTALL FIRST STAGE (FAN) BLADES
7. INSTALL COMPRESSOR INLET CONE
8. INSTALL N1 SPEED SENSOR

L−A1497 (0786)
PW V

Procedure Sequence
Figure 401
(Task 72−00−61−420−003)

(3) Using hoist and sling, lift gearbox and position over fixture (402/3). Lower gearbox and position four post details of fixture to four ground handling points of gearbox. Secure post details to gearbox with four detail cap screws (402/4). See Figure 402.

(4) Install new packings, lubricated with Engine Oil (P03−001), on gearbox driveshaft (front) housing (403/3). See Figure 403.
  (a) Install packing (403/9) in groove on rear of housing.
  (b) Install packing (403/13) in groove on front of housing.

(5) Insert gearbox driveshaft (403/12) and driveshaft (front) housing (403/3) in driveshaft housing (403/8) and telescope rearward, carefully mating driveshaft splines with internal splines on gearbox spline lockring.

(6) If not installed on the engine, install the two support links (404/8) in the gearbox support clevises (404/3) on Flange K. See Figure 404.
  (a) With the support links in position in the clevises, install the spacers (404/4) in the rear holes of the clevises. Install the pins (404/2), flanged ends forward, in the front holes of the clevises.
  (b) Install new washers (404/5) on the bolts. Install the bolts (404/6), heads rearward, threads lubricated with Engine Oil (P03−001), in the spacers. Install nuts (404/1) on the bolts.
  (c) Torque the bolts to 290 − 325 lb−in. (32.766 − 36.720 N.m). Install a cotter pin (404/7) in each bolt.

(7) Raise gearbox with sling. Secure PWA 85241 Lifting Arm (402/1) to handling fixture using four detail screws (402/2). There are three possible attachment positions, depending on the components installed on the gearbox.

(8) Pass second nylon sling through eye in lifting arm and secure to second hoist. Transfer load from first hoist to second hoist. Remove first sling and hoist.

(9) Make sure that spherical bearings (404/9) are installed in support links (404/8) and in the lower end of the (driveshaft housing) support link (403/6). Make sure that the bearings turn freely.

(10) Position gearbox to align lug at top center of gearbox with mating part in compressor case and align support links (404/8) on engine with lugs on upper right and left sides of gearbox.

(11) Install the gearbox on the support links (404/8) as follows.

Main Gearbox Installation
Figure 404
(Task 72−00−61−420−003)

(a) Install spacer (404/13) into hole in rear of the clevis on the gearbox. Insert pin (404/14), flanged end toward the front, through clevis on gearbox.
(b) Install a new washer (404/12) on the bolt (404/10). Install the bolt (404/10), head rearward, threads lubricated with Engine Oil (P03−001), in the clevis. Install a nut (404/15) on the bolt.
(c) Torque the bolt to 290 − 325 lb−in. (32.766 − 36.720 N.m). Secure nut using cotter pin (404/11).
(d) Repeat procedure to secure support link to clevis on right side of gearbox.

(12) Align bolthole in support link (403/6) spherical bearing with boltholes in clevis on gearbox driveshaft housing (403/8). Secure support link using bolt (403/7) and nut (403/5). Torque nut to 515 − 575 lb−in. (58.187 − 64.966 N.m). Secure nut using cotter pin (403/4). See Figure 403.

(13) Position retaining ring (403/14) on forward end of driveshaft (403/12). Move driveshaft forward carefully, mating driveshaft splines with internal splines in gearbox drive coupling (403/18). Install retaining ring (403/14) in coupling in angle gearbox to secure front end of driveshaft.

NOTE: Driveshaft must mate, in front, with angle gearbox drive coupling (403/18) splines and in rear, with main gearbox drive gearshaft splines. If splines are out of alignment, driveshaft will not seat in drive coupling (402/18). In order to align angle and main gearbox splines/teeth, remove the bolts and washers in the gearbox that attach the cover (manual crank). Remove the cover. Use PWA 85768 Puller. Rotate main gearbox drive gearshaft by turning the gearshaft. To install the cover, install a new packing, lubricated with Engine Oil (P03−001) on the cover. Install the cover. Attach it with washers and bolts. Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(14) Align boltholes and telescope gearbox driveshaft (front) housing (403/3) forward and seat on rear flange of angle gearbox housing (403/17). Position bracket (403/1) over top right bolthole in driveshaft (front) housing (403/3) and install bolt (403/10). Position bracket (403/2) over top left bolthole in driveshaft (front) housing and install bolt (403/10). Install washers (403/11) onto four bolts (403/10) and install

bolts through remaining boltholes in driveshaft (front) housing and angle gearbox housing. Install washers (403/16) and nuts (403/15) to all six bolts. Torque bolts to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(15) Lubricate four bolts (402/5) with Engine Oil (P03-001). Install two bolts in each bracket securing driveshaft (front) housing to high pressure compressor. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Install lockwire.

(16) Remove gearbox handling fixture from gearbox.

(17) Remove tool assembly and sling from hoist.

D. Postrequisites

(1) Trunnion engine from front end down to horizontal position per 72-00-00, Special Procedures-XX (Task 72-00-00-410-XXX).

(2) Install LPT with shaft per 72-00-53, Installation-01 (Task 72-00-53-420-001).

(3) Install turbine exhaust case per 72-00-54, Installation-01 (Task 72-00-54-420-001).

(4) Install low pressure compressor per 72-00-31, Installation-01 (Task 72-00-31-420-003).

(5) Connect/install external parts to complete installation of main gearbox per Installation-02 (Task 72-00-61-420-003).

(6) Install ignition exciters per Installation-03 (Task 72-00-61-450-001) and Installation-04 (Task 72-00-61-450-002).

(7) Install fuel pump and fuel metering unit (package) per Installation-05 (Task 72-00-61-450-003).

(8) Service engine oil system per 72-00-00, Servicing-03 (Task 72-00-00-610-003).

(9) Test engine per Test Reference Table. See 71-00-00, Testing-00 (Task 71-00-00-990-003).

Task 72-00-61-450-015:

1. Install The Core Engine EEC Wiring Harnesses W3 And W5 After The Main Gearbox Installation

A. Equipment And Materials Necessary

Standard Tools:

Glenair TG-70 Strap Wrench or
Glenair TG-69 Soft Jawed Pliers

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P11-009	Alcohol, Denatured Ethyl (AMS 3002)

B. Procedure
See Figure 401.

CAUTION: SEE 72-00-00, INSTALLATION-00 FOR THE GENERAL INSTALLATION REQUIREMENTS FOR THE ELECTRICAL HARNESSES, LEADS, AND CABLES.

CAUTION: DO NOT TWIST OR BEND THE HARNESS BADLY DURING THE INSTALLATION, OR DAMAGE TO THE HARNESS CAN OCCUR.

(1) (Pre SB PW4ENG 73-84) Connect the W3P18 harness connector to the mating harness receptacle as follows: See Figure 401.

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11-009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:
- the connector coupling nut is fully tight
- the connector fits tightly against the receptacle (metal to metal).
- This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

(2) (Post SB PW4ENG 73−84), For a thermocouple probe with a studded terminal type receptacle install the wiring harness as follows.

CAUTION: DO NOT LUBRICATE THREADS ON THERMOCOUPLE WIRING HARNESS CONNECTIONS (TERMINAL STUDS). LUBRICATION OF THREADS ON THE THERMOCOUPLE COULD CAUSE MALFUNCTION OF THE THERMOCOUPLE.

(a) Install the wiring harness terminals to the thermocouple studs and install loosely the nuts to the thermocouple studs.

(b) Install the clamp, ground strap, and bolt loosely to the bracket on the housing.

CAUTION: TO PREVENT DAMAGE TO THE WIRING HARNESS, MAKE SURE THE THERMOCOUPLE STUD BOX DOES NOT TURN WHEN THE COUPLING NUT IS TORQUED.

(c) If necessary to align the thermocouple stud box, remove the lockwire from the thermocouple coupling nut to the adapter and loosen the coupling nut.

(d) Align the thermocouple stud box with the wiring harness connector.

(e) (Reference 2167) Hold the thermocouple stud box and torque the thermocouple probe coupling nut to 95 − 100 lb−in. (10.734 − 11.298 N.m). Do not let the thermocouple studs turn.

CAUTION: DO NOT ALIGN THE THERMOCOUPLE STUD BOX AFTER THE COUPLING NUT IS TORQUED. HOLD THE THERMOCOUPLE STUD BOX AND LOOSEN THE COUPLING NUT AND ALIGN THE THERMOCOUPLE STUD BOX AGAIN.

(f) Make sure the thermocouple stud box is aligned. Do not put too much force on the terminals of the wiring harness.

CAUTION: TOO MUCH TORQUE (MORE THAN MAXIMUM TORQUE) ON THE THERMOCOUPLE NUTS CAN LOOSEN OR DAMAGE THE THERMOCOUPLE STUDS.

(g) (Reference 2273) Torque the alumel nuts (larger terminal studs) to 18 − 22 lb−in. (2.034 − 2.486 N.m).

(h) (Reference 2273) Torque the chromel nuts (smaller terminal studs) to 15 − 18 lb−in. (1.695 − 2.034 N.m).

(i) Install lockwire from the coupling nut to the adapter.

(j) Torque the bolt that attachs the clamp and ground strap to the bracket on the housing to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(3) Connect the W3 and the W5 harness connectors (given below) to the mating harness receptacles as follows. See Figure 401. For each connector:

(a) Remove the protection covers. Examine the harness connector and the mating receptacle for bent pins and contamination. If necessary, carefully make straight any bent pins. If necessary, clean the connector and receptacle with Denatured Ethyl Alcohol P11−009. Let dry.

(b) Align the connector keyways and engage the connector to the mating receptacle. Tighten the connector coupling nut by hand until you cover the witness (color) band and the connector coupling nut is hand tight.

NOTE: The witness (color) band is the first band on the receptacle that you cover when you tighten the connector coupling nut.

CAUTION: USE THE CORRECT ASSEMBLY TOOLS. USE OF THE WRONG ASSEMBLY TOOLS CAN RESULT IN CONNECTOR DAMAGE OR A LOOSE CONNECTOR. A LOOSE CONNECTOR PERMITS VIBRATION AND CAN RESULT IN CONTACT WEAR AND POOR LIGHTNING PROTECTION.

(c) Use the Glenair TG−70 Strap Wrench or the Glenair TG−69 Soft−Jawed Pliers and tighten the connector coupling nut. Use sufficient force to be sure:

− the connector coupling nut is fully tight
− the connector fits tightly against the receptacle (metal to metal).
− This procedure will make sure the contacts are sufficiently engaged and the connector is tight.

NOTE: If you use too much force, the tools (above) will turn around on the connector coupling nut. This will prevent too much torque.

NOTE: See the instructions given with the strap wrench for correct use.

Connector	Component	Location
W5P6	EEC Alternator (Lower Connector)	Bottom Of Gearbox 7 O'Clock
W3P1	EEC Alternator (Upper Connector)	Bottom Of Gearbox 7 O'Clock
W3P18	EEC Oil Temperature Thermocouple Probe	Front Of Gearbox 7 O'Clock

(4) Adjust the harnesses for any necessary clearances as required. Install the clamps at all clamp points. Refer to the figures. Attach the clamps loosely to the

engine with bolts and/or nuts, threads lubricated with Engine Oil P03−001.

NOTE: Use different clamp sizes on the harnesses to prevent harness movement when tightened. See the Illustrated Parts Catalog for selection of the clamp sizes and part numbers.

(5) Make sure that the harnesses are not tight to the point where sharp bends are caused, and that the harnesses do not touch any engine parts or plumbing. Provide a drip loop on the leads where the wires run downward into the connector.

(6) Tighten all the previously installed clamp nuts and/or bolts to a torque of 36 − 40 lb−in. (4.067 − 4.519 N.m).

Figure 401 (Sheet 3)
(Task 72−00−61−450−015)

Task 72-00-61-430-001:

1. Install Main Oil Filter

A. Equipment And Materials Required

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
R P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Filter Element	1	79-21-00/2/120
Packing	1	79-21-00/2/160
Packing	1	79-21-00/2/230

B. Procedure
See Figure 401.

(1) (Pre SB PW4ENG 72-524) Install the main oil filter element and cover as follows: See Figure 401 (Sheet 1) and Figure 401 (Sheet 2).

(a) Remove the protective closures and check the oil filter cavity for old seal parts and remove any that are found.

CAUTION: OIL FILTER ELEMENTS HAVE A REMOVABLE PLUG IN THE END CAP WHICH MUST BE IN PLACE BEFORE INSTALLING THE FILTER ELEMENT INTO THE HOUSING OR THE OIL WILL NOT BE FILTERED.

(b) Align the bolt hole and position key washer (401/7) in the center of the cover (401/15) with the tab of the key washer in the mating hole in the cover. Secure the key washer with the screw (401/6), lubricated with Engine Oil P03-001.

Torque screw to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Install the spring (401/5) on the key washer (401/7). Bend the tabs of the washer out between the coils of the spring.

(d) Install a new packing (401/8), lubricated with Engine Oil P03-001, into the groove in OD of the main oil strainer cover (401/15).

(e) Install the filter element (401/4) with the plugged end outward, into the opening in the bottom of the cover (401/15). Align the bolt holes and install the cover with the filter element into the main oil filter housing (401/3).

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING BOLTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/15) in position on the housing (401/3), carefully push the cover on to the housing until the flange of the cover touches the housing.

NOTE: The drain opening in the cover should be toward the outboard side of the filter housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING BOLTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/15) with four washers (401/14) and bolts (401/13). Torque bolts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

(2) (Post SB PW4ENG 72-524 and Pre SB PW4ENG 79-79) Install the main oil filter element and cover as follows: See Figure 401 (Sheet 3) and Figure 401 (Sheet 4).

(a) Remove the protective closures and check the oil filter cavity for old seal parts and remove any that are found.

CAUTION: OIL FILTER ELEMENTS HAVE A REMOVABLE PLUG IN THE END CAP WHICH MUST BE IN PLACE BEFORE INSTALLING THE FILTER ELEMENT INTO THE HOUSING OR THE OIL WILL NOT BE FILTERED.

(b) Align the bolt hole and position the key washer (401/7) in the center of the cover (401/15) with the tab of the key washer in the mating hole in the cover. Secure the key washer with the screw (401/6), lubricated with Engine Oil P03−001. Torque the screw to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(c) Install the spring (401/5) on the key washer (401/7). Bend the tabs of the washer out between the coils of spring.

(d) Install a new packing (401/8), lubricated with Engine Oil P03−001, into the groove in the OD of the main oil strainer cover (401/15).

(e) Install the filter element (401/4) into the opening in the bottom of the cover (401/15). Align the bolt holes and install the cover with the filter element into the main oil filter housing (401/3).

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/15) in position over the studs in the housing (401/3), carefully push the cover on the housing until the flange of the cover touches the housing.

NOTE: The drain opening in the cover should be toward the outboard side of the filter housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/15) to the housing.

1 If self-locking nuts are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/29). Lubricate the threads with Engine Oil P03-001. Torque nuts to 150 - 170 lb-in. (16.948 - 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/30). Lubricate the threads with Engine Oil P03-001. Torque nuts to 125 - 150 lb-in. (14.123 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the nuts.

(3) (Post SB PW4ENG 72-524 and SB PW4ENG 79-79) Install the main oil filter element and cover as follows: See Figure 401 (Sheet 5) and Figure 401 (Sheet 6).

(a) Remove the protective closures and check the oil filter cavity for old seal parts and remove any that are found.

CAUTION: OIL FILTER ELEMENTS HAVE A REMOVABLE PLUG IN THE END CAP WHICH MUST BE REMOVED BEFORE INSTALLING THE FILTER ELEMENT INTO THE HOUSING OR THE OIL WILL NOT BE FILTERED.

(b) Install the spring (401/5) in the spring retainer (401/23).

(c) Install two screws (401/22) through the spring retainer screw holes and then install two washers (401/20) on the ends of the two screws.

(d) Lubricate the threads of the two screws (401/22) with Engine Oil P03−001.

(e) With the spring (401/5) in place in the spring retainer (401/23), thread the two screws (401/22) into the main oil strainer cover (401/21). Torque the two screws to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Install new packing (401/8), lubricated with Engine Oil P03−001, into the groove in the OD of the main oil strainer cover (401/21).

(g) Install the filter element (401/4) into the opening in the bottom of the cover (401/21). Align the bolt holes and install the cover with the filter element into the main oil filter housing (401/3).

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(h) With the cover (401/21) in position over the studs in the housing (401/3), carefully push the cover on the housing until the flange of the cover touches the housing.

NOTE: The drain opening in the cover should be toward the outboard side of the filter housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN−FLIGHT−SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(i) Attach the cover (401/21) to the housing.

1 If self-locking nuts are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/29). Lubricate the threads with Engine Oil P03-001. Torque nuts to 150 - 170 lb-in. (16.948 - 19.207 N.m).

2 If hex nuts with lockwire provisions are used, attach the cover to the housing with four (4) washers (401/14) and nuts (401/30). Lubricate the threads with Engine Oil P03-001. Torque nuts to 125 - 150 lb-in. (14.123 - 16.948 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the nuts.

(4) (Post SB PW4ENG 72-525) Install the main oil filter element and cover as follows: See Figure 401 (Sheet 7) and Figure 401 (Sheet 8).

(a) Remove the protective closures and check the oil filter cavity for old seal parts and remove any that are found.

CAUTION: OIL FILTER ELEMENTS HAVE A REMOVABLE PLUG IN THE END CAP WHICH MUST BE REMOVED BEFORE INSTALLING THE FILTER ELEMENT INTO THE HOUSING OR THE OIL WILL NOT BE FILTERED.

(b) Install pressure relief valve (401/41) in center of cover (401/42) and attach with retaining ring (401/40).

(c) Install new packing (401/8), lubricated with Engine Oil P03-001, into groove in OD of main oil strainer cover (401/42).

(d) Remove the protective closure from the end of the filter element (401/39).

(e) Install the filter element (401/39) over the pressure relief valve (401/41) in cover (401/42). Align bolt holes and dowel pin in cover with studs and dowel pin hole in main oil filter housing (401/3), then install cover with filter element into main oil filter housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: INCORRECT INSTALLATION OF THE COVER CAN CAUSE DAMAGE TO THE PACKING.

CAUTION: DO NOT USE THE COVER RETAINING NUTS TO PULL THE COVER INTO THE HOUSING. TO DO SO CAN CAUSE DAMAGE TO THE PACKING.

(f) With the cover (401/42) in position over the studs and dowel pin hole in the housing, carefully push the cover on the housing until the flange of the cover touches the housing.

CAUTION: INCORRECT INSTALLATION OF THIS PART CAUSED AN IN-FLIGHT-SHUTDOWN.

CAUTION: BE SURE TO TORQUE THE COVER RETAINING NUTS TO THE TORQUE SPECIFIED.

(g) Attach the cover (401/42) with four washers (401/14) and nuts (401/29). Torque nuts to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(5) (Pre SB PW4ENG 72-525) Install new packing (401/9), lubricated with Engine Oil P03-001, onto insert (401/10).

(6) (Pre SB PW4ENG 72-525) Install insert, lubricated with Engine Oil P03-001, into opening in bottom of cover (401/15 or 401/21, as applicable). Torque insert to 200 - 225 lb-in. (22.597 - 25.422 N.m).

(7) (Pre SB PW4ENG 72-525) Install new packing (401/11), lubricated with Engine Oil P03-001, onto plug (401/12).

(8) (Pre SB PW4ENG 72-525) Install plug (401/12), lubricated with Engine Oil P03-001, into previously installed insert (401/10). Torque plug to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 the plug.

(9) (Post SB PW4ENG 72-525) Install new packing (401/11), lubricated with Engine Oil P03-001, onto plug (401/12). See Figure 401 (Sheet 4).

(10) (Post SB PW4ENG 72−525) Install plug (401/12), lubricated with Engine Oil P03−001, into threaded hole in bottom of cover (401/42). Torque plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 the plug. See Figure 401 (Sheet 4).

C. Postrequisites

(1) Service oil system per 72−00−00, Servicing−03 Task 72−00−00−610−003.

(2) Test engine per Test Reference Table. See 71−00−00, Testing−00 Task 71−00−00−990−003.

(Task 72-00-61-430-001)

Task 72-00-61-450-017:

1. Install The Magnetic Chip Detector Assemblies

A. General

(1) To install a full magnetic plug assembly, first install the valve, then install the plug.

B. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

C. Installation Of The Magnetic Chip Detectors

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(1) Install the magnetic chip detector to the engine oil tank. See Figure 401.

(a) Install the PN 50R499 magnetic chip detector to the engine oil tank as follows:

1 If necessary, install the magnetic probe (401/15) into the valve (401/4) to get access to the packing grooves.

2 Apply Engine Oil P03-001 to the new packing (401/2).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03-001 to the new packing (401/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the engine oil tank.

8 Torque the valve to 200 - 225 lb-in. (22.597 - 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (401/3).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(b) Install the PN 50R485 magnetic chip detector to the engine oil tank as follows:

1 If necessary, install the magnetic probe (401/9) into the valve (401/7) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (401/6).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (401/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the engine oil tank.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (401/8).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(c) Install the PN 50R423 (option 1) magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (401/1).

2 Install the new packing to the washer face of the valve (401/10).

3 Install the valve into the engine oil tank.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (401/11).

7 Install the new packing to the groove on the magnetic probe (401/12).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(d) Install the PN 50R423 (option 2) magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (401/1).

2 Install the new packing to the washer face of the valve (401/13).

3 Apply Engine Oil P03−001 to the new packing (401/14).

4 Install the new packing to the ID of the valve.

5 Install the valve into the engine oil tank.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (401/15).

9 Install the new packing to the groove on the magnetic probe (401/16).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(e) Install the PN 50R374 magnetic chip detector to the engine oil tank as follows:

1 Apply Engine Oil P03−001 to the new packing (401/1).

2 Install the new packing to the washer face of the valve (401/17).

3 Install the valve into the engine oil tank.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (401/18).

7 Install the new packing to the groove on the magnetic probe (401/19).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(2) Install the four magnetic chip detectors to the lubrication and scavenge oil pump. See Figure 402.

(a) Install the PN 50R342 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (402/1).

2 Install the new packing to the washer face of the valve (402/2).

3 Install the valve into the engine oil tank.

4 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (402/3).

7 Install the new packing to the groove on the magnetic probe (402/4).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

11 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(b) Install the PN 50R348 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (402/1).

2 Install the new packing to the washer face of the valve (402/8).

3 Apply Engine Oil P03−001 to the new packing (402/7).

4 Install the new packing to the ID of the valve.

5 Install the valve into the lubrication and scavenge oil pump.

6 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (402/6).

9 Install the new packing to the groove on the magnetic probe (402/5).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

13 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(c) Install the PN 50R492 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 If necessary, install the magnetic probe (402/2) into the valve (402/10) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (402/9).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (402/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the lubrication and scavenge oil pump.

8 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (402/11).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

15 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(d) Install the PN 50R491 magnetic chip detector to the lubrication and scavenge oil pump as follows:

1 Apply Engine Oil P03−001 to the new packing (402/1).

2 Install the new packing to the washer face of the valve (402/16).

3 Apply Engine Oil P03−001 to the new packing (402/15).

4 Install the new packing to the ID of the valve.

5 Install the valve into the lubrication and scavenge oil pump.

6 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (402/14).

9 Install the new packing to the groove on the magnetic probe (402/13).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

13 Do this procedure again for the remaining three locations on the lubrication and scavenge oil pump.

(e) Install the PN 50R501 magnetic chip detector to the engine oil tank as follows:

1 If necessary, install the magnetic probe (402/20) into the valve (402/18) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (402/17).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (402/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the engine oil tank.

8 Torque the valve to 90 − 100 lb−in. (10.169 − 11.298 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (402/19).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

CAUTION: REMOVE THE PROTECTIVE COVERS FROM THE OPENINGS AS NECESSARY TO PREVENT ENGINE DAMAGE.

CAUTION: DO NOT TRY TO INSTALL THE CHIP DETECTOR AS AN ASSEMBLY. YOU MUST REMOVE THE MAGNETIC PROBE FROM THE VALVE TO PREVENT DAMAGE TO THE PARTS.

(3) Install the magnetic chip detector to the center front side of the main gearbox assembly. See Figure 403.

(a) Install the PN 50R341 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (403/1).

2 Install the new packing to the washer face of the valve (403/2).

3 Install the valve into the center front side of the main gearbox assembly.

4 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

5 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

6 Apply Engine Oil P03−001 to the new packing (403/3).

7 Install the new packing to the groove on the magnetic probe (403/4).

8 Install the magnetic probe into the valve.

9 Push the magnetic probe in and turn it clockwise until it locks.

10 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(b) Install the PN 50R347 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (403/1).

2 Install the new packing to the washer face of the valve (403/5).

3 Apply Engine Oil P03−001 to the new packing (403/6).

4 Install the new packing to the ID of the valve.

5 Install the valve into the center front side of the main gearbox assembly.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (403/7).

9 Install the new packing to the groove on the magnetic probe (403/8).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(c) Install the PN 50R485 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 If necessary, install the magnetic probe (403/12) into the valve (403/10) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (403/9).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (403/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the center front side of the main gearbox assembly.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (403/11).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(d) Install the PN 50R484 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 Apply Engine Oil P03−001 to the new packing (403/1).

2 Install the new packing to the washer face of the valve (403/13).

3 Apply Engine Oil P03−001 to the new packing (403/14).

4 Install the new packing to the ID of the valve.

5 Install the valve into the center front side of the main gearbox assembly.

6 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

7 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

8 Apply Engine Oil P03−001 to the new packing (403/15).

9 Install the new packing to the groove on the magnetic probe (403/16).

10 Install the magnetic probe into the valve.

11 Push the magnetic probe in and turn it clockwise until it locks.

12 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

(e) Install the PN 50R499 magnetic chip detector to the center front side of the main gearbox assembly as follows:

1 If necessary, install the magnetic probe (403/20) into the valve (403/18) to get access to the packing grooves.

2 Apply Engine Oil P03−001 to the new packing (403/17).

3 Install the new packing to the small OD end of the valve.

4 Apply Engine Oil P03−001 to the new packing (403/1).

5 Install the new packing to the washer face of the valve.

6 Remove the magnetic probe from the valve.

7 Install the valve into the center front side of the main gearbox assembly.

8 Torque the valve to 200 − 225 lb−in. (22.597 − 25.422 N.m).

9 Safety the valve with Lockwire P05−289 or Safety Cable P05−291 and Ferrule P05−292.

10 Apply Engine Oil P03−001 to the new packing (403/19).

11 Install the new packing to the groove on the magnetic probe.

12 Install the magnetic probe into the valve.

13 Push the magnetic probe in and turn it clockwise until it locks.

14 Pull on the magnetic probe to make sure it is locked.

NOTE: The probe is correctly installed when you align the red mark on the magnetic probe with the red mark on the valve.

PART NAME	QUANTITY	SECTION	FIGURE	ITEM
Packing	1	79-11-00	3	10
Packing	1	79-11-00	3	20

   B. Procedure

   (1) If the cap is disassembled, assemble it. See Figure 401.

   (a) Apply Engine Oil (P03-001) to a new packing (401/5). Install the packing to the packing groove in the lock (401/10).

   (b) Assemble the lock (401/10), spring (401/9), plate (401/8), cap (401/6), and washer (401/4).

   (c) Put the handle (401/2) in position on the shaft of the lock (401/10) and the cap (401/6). Press together the lock (401/10) and the cap (401/6). While pressed together, put the pin (401/3) through the handle (401/2).

   (2) Install the oil tank cap. See Figure 402.

   (a) If not installed, install a new packing (401/7) lubricated with Engine Oil (P03-001), in the packing groove on the cap.

   (b) With the handle at OPEN, align the lugs of the cap with the slots of the filler neck valve.

   (c) Install the cap.

   (d) Push down on the cap while you turn the handle clockwise to CLOSE.

Figure 402
(Task 72−00−61−440−002)

(e) Push the handle in the recess. This locks the cap.

(f) Make sure that the cap is locked.

- 1 Try to pull up on the edge of the cap.
- 2 With your hand, apply pressure to the outer edge of the cap at opposite points.
- 3 The cap must not move.
- 4 If necessary, remove the cap and repeat the procedure.

ENGINE GENERAL - MAIN GEARBOX - INSTALLATION-39

Task 72-00-61-450-019:

1. Install The No. 3 Bearing Breather And Restrictor Valve (Pre SB PW4ENG 75-144)

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-021	Compound, Antigalling (PWA 550-3)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing AS3209-213	1	

B. Procedure
See Figure 401.

(1) Install the No. 3 bearing breather and restrictor valve to the deoiler on the gearbox as follows.

(a) Remove the protection covers from the openings.

(b) Lubricate the packing with Engine Oil P03-001 and install the packing to the groove on the elbow of the restrictor valve.

(c) Install the restrictor valve to the three-hole mount pad on the deoiler on the front right side of the gearbox. Attach the valve with bolts, threads lubricated with Engine Oil P03-001 and tighten by hand.

(d) Install the face seal between the upper three holepad on the restrictor valve and the No. 3 bearing breather tube (LB04). Attach the tube to the valve with bolts, threads lubricated with Engine Oil P03-001, and tighten by hand.

(e) Lubricate the tube nut of the No. 3 bearing breather and restrictor valve, air supply tube (AP39) with Antigalling Compound P06-021. Connect the tube to the restrictor valve and tighten by hand.

(f) Torque the bolts that attach the restrictor valve to the deoiler to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(g) Torque the bolts that attach the No. 3 bearing breather tube (LB04) to the restrictor valve to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(h) Torque the tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install lockwire to the tube nut.

ENGINE GENERAL - MAIN GEARBOX - CLEANING-01

Task 72-00-61-160-001:

1. Clean Ignition Exciter Contact Well
   A. Equipment And Materials Required

      Consumable Material:

Item No.	Description
P05-050	Abrasive Rod, Rubberized

   B. Procedure
      (1) Remove dirt, or foreign matter from inside contact well with compressed air.

      NOTE: Compressed air shall be maintained at 30 psig (206.8 kPa) maximum discharge pressure. Dirt on contact surface will cause reduced output or arcing.

      WARNING: USE CLEANING SOLVENT IN WELL-VENTILATED AREA. AVOID CONTACT WITH SKIN.

      (2) Clean ignition exciter outlet contact well with long bristle, nonmetallic brush and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air. Minor arcing and discoloration of the contact button can be removed by resurfacing the button with Abrasive Rod (P05-050), using a circular movement of the hand. Repeat above cleaning procedure.
      (3) Clean inner ceramic walls using circular felt bob, 1/2 inch (12.7 mm) in diameter and approximately 1 3/4 inches (44.450 mm) long, suitable for use with hand chuck. Use the SPOP 208 Wipe Method (Task 70-21-00-110-040), and clean using circular movement of hand. Dry with compressed air.
      (4) Clean end surface of ceramic at seat of grommet face using short bristle nonmetallic brush and the SPOP 208 Wipe Method (Task 70-21-00-110-040). Dry with compressed air.

ENGINE GENERAL − MAIN GEARBOX − INSPECTION/CHECK−01

Task 72−00−61−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum - maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

ENGINE GENERAL – MAIN GEARBOX – INSPECTION/CHECK-02

Task 72-00-61-210-003:

1. Inspect Fuel Pump Filter
   A. Prerequisites
      (1) Refer to Removal-24 (Task 72-00-61-060-001) to remove the fuel pump filter.
   B. Equipment And Materials Required – None
   C. Procedure

      (1) Remove the paper outer wrap from around the filter to examine the pleated paper element.
      (2) Examine the paper element for signs of damage or for a collection of contamination.
      (3) Replace the used filter element with a new filter element.

      NOTE: Do NOT clean the filter element. Do NOT use the same filter element again.

      (4) If there is damage or a large quantity of contamination in the paper element, examine (in the direction of flow) the filter element in the fuel distribution valve. Refer to 72-00-41, Inspection/Check-05.
   D. Postrequisites
      (1) Refer to Installation-24 (Task 72-00-61-460-001) to install the fuel pump filter.

ENGINE GENERAL - MAIN GEARBOX - INSPECTION/CHECK-03

Task 72-00-61-210-001:

1. Inspect Ignition Exciter

A. Equipment And Materials Required

Standard Tools:
1.000-20UNS-3A Thread Chasing Die

B. Procedure

CAUTION: USE EXTREME CARE NOT TO CAUSE BURRS.

(1) Inspect input connector for bent or damaged pins. Bent pins may be straightened using needlenose pliers. Damaged pins will require exciter replacement.

(2) Inspect output receptacle well for damage or signs of arcing or flashover on contact button. Arcing is identified by pitting or discoloration on contact button. Flashover is identified by carbon tracking. If any of these indications are evident, send exciter to repair facility. Minor discoloration and pitting of contact button and minor carbon tracking can be removed per Cleaning-01 (Task 72-00-61-160-001).

(3) Inspect threads of each outlet. Minor repair to threads can be made by chasing with 1.000-20UNS-3A Thread Chasing Die. If threads are damaged beyond minor repair, exciter must be replaced.

(4) Inspect case for cracks, dents, or abrasions.

Previous Pageblock Return to Previous Menu Next Pageblock

ENGINE GENERAL – MAIN GEARBOX – INSPECTION/CHECK-04

Task 72-00-61-210-002:

1. Inspect The Magnetic Probes

A. Prerequisites

(1) Remove the magnetic probe from the valve. Refer to Removal-36 (Task 72-00-61-050-017).

B. Equipment And Materials Necessary

Special Tools:
PWA 107014 Photo Aide

Consumable Materials:

	Item No.	Designation
R	P11-014	Alcohol, Isopropyl (PMC 9094)
	P11-027	Solvent, Petroleum (PMC 9001)

C. General

CAUTION: DO NOT PERMIT THE MAGNETS ON THE PROBES
R TO TOUCH EACH OTHER OR THEY CAN BECOME
DEMAGNETIZED.

(1) Upon removal of each probe, you must immediately
R identify the position of that probe. See Figure 801.

(2) It is necessary to keep records of all contamination that is on the probes and in the oil filter.

R (3) You must examine the contamination with suitable
magnification. Although it is permitted to use a
R magnifying glass, it is recommended that you use a
R magnifying glass that has 20X magnification.

(4) If the engine or gearbox can not continue in service,
R you must send the debris contamination and/or analysis
of the contamination with the engine or gearbox to the
repair facility.

D. Inspection Procedure
See Figure 802.

R (1) Examine the probes for debris contamination. Use the
R procedure in the paragraph "Magnetic Chip Detector
R Examination Procedure".

(2) If, after you remove the magnetic probe, oil leaks from the valve, replace the valve packing. Refer to Removal-36 (Task 72-00-61-050-017) and Installation-36 (Task 72-00-61-450-017). If the valve still leaks with the new valve packing, replace the valve.

(3) Examine the packing on the probes. If the packing is damaged, replace the packing. Refer to Removal-36 (Task 72-00-61-050-017) and Installation-36 (Task 72-00-61-450-017).

NOTE: The shape of the grip and the quantity of packings can be different from what is shown in the figure.

(4) Before you install the probe, clean the probe with Solvent P11-027, then dry them with a clean cloth. Make sure that you remove all contamination.

(5) Before you install the probe, do the procedure in the
R paragraph "Magnetic Chip Detector Probe Functional
R Check Procedure".

R E. Magnetic Chip Detector Examination Procedure

(1) This procedure gives instructions on how to interpret
R the debris contamination that is on the magnetic probes. Refer to the paragraph "Spectroscopic Analysis" for information on the methods of quantitative analysis and on the composition of the
R debris contamination.

R (2) There are four main types of debris contamination:

R 1 Contamination from the assembly of the
R engine (called build debris or residual debris)
R 2 Fines
R 3 Flakes
R 4 Chips

(3) If there is contamination, make a record of the position of the probes. Examine the probe with
R suitable magnification. Make a record of the quantity
R and type of debris contamination that is there.

R NOTE: The PWA 107014 Photo Aide can be used as an aid
R showing actual photos of conditions which you
R can find during an MCD inspection.

(a) If the probe is covered by a drop of oil, add a few drops of Alcohol P11−014 to the probe tip. The alcohol should help break the surface tension of the oil and allow the oil to flow down the body of the probe. After a few minutes, metallic particles are expected to be observed on the probe tip.

NOTE: This condition where the probe tip is covered by a drop of oil is shown in the PWA 107014 Photo Aide (Condition C). This condition is usually the result of fine metallic particles holding the oil near the collector and is the reason for performing the preceding step whenever these conditions are found.

(4) If there is a question of what type of debris contamination that you see, obey the action that follows the stricter interpretation.

(5) Build debris or residual debris. See Figure 803, Figure 804 (Sheet 1), (Sheet 2), and Figure 807.

NOTE: The PWA 107014 Photo Aide (see Condition A) can be used as an aid showing actual photos of conditions which you can find during an MCD inspection.

(a) Description: Build debris normally collects during the early stages, the first 1000 hours of engine operation after assembly of the engine. Build debris or residual debris can look like strands of curly steel wool, shavings, or burrs.

(b) Source: This is residual material that is accidentally left in or enters the engine at assembly. Build debris or residual debris typically comes from machine operations when the components are made or assembled.

(c) Action: The engine can continue−in−service. Obey the usual magnetic probe inspection interval.

NOTE: "Usual magnetic chip detector probe inspection interval" is the interval that the individual operator has established as part of the approved maintenance program.

1 After 1000 hours of engine operation do an analysis of chips or flakes (these are not specified as build or residual debris).

2 See Table 801 and Table 802 for a list of the composition and location of the various commonly used bearing and gear materials.

(6) Magnetic fines. See Figure 804 (Sheet 1), Figure 804 (Sheet 2), and Figure 807.

(a) Description: These are very small particles. They are less than 0.010 inch (0.254 mm) long and of different widths. They appear as a black or gray sludge or fuzz on the magnetic probe. When the oil on the probe is removed, they appear as dull hairlike slivers. Fines are typical of low−time engines and small amounts are serviceable.

(b) Source: The usual wear of various engine components can cause a small quantity of fines. This is a serviceable condition. Bearing skid and the spinning of parts such as spacers, seal plates, and shaft probes can also cause fines. Bearing skid and spinning make fines at a higher rate than usual wear. This is not a serviceable condition. Service experience shows that only the deoiler idler gear bearing in the main gearbox is subject to bearing skid that can generate fines.

(c) Action: If there are fines on less than 25 percent of the probe tip perimeter (see PWA 107014 Photo Aide (Condition B and Figure 804 (Sheet 2)) the engine can continue in service. Obey the usual magnetic probe inspection interval.

1 If the fines collected on the probe tip make up more than 25 percent of the probe tip's perimeter (see Figure 804 (Sheet 2), also PWA 107014 Photo Aide Condition E shows a non acceptable amount of fines) examine the individual compartment chip collectors for debris.

2 If any individual MCD probe has 100 percent coverage of fines, the engine is not serviceable.

R 3 If there is debris on more than 25 percent of any of the individual probe tip's perimeter (see Figure 804 (Sheet 2), also PWA 107014 Photo Aide shows a non acceptable amount of fines as Condition E) and less than 100 percent surface coverage, then examine the main oil filter element.

(d) If the fines that are on the tip of the magnetic probe are on more than 25 percent of the probe tip's circumference or area, do the steps that follow: R

1 Remove the main oil filter. Refer to 72-00-61, Removal-35 (Task 72-00-61-030-001). Keep the oil that is in the oil filter housing.

2 Flush the filter with Petroleum Solvent P11-027.

3 Strain the solvent through filter paper or clean cloth. Keep the debris contamination for identification. R

4 Install a new main oil filter. Refer to 72-00-61, Installation-35 (Task 72-00-61-430-001).

5 Examine the main oil filter and filter housing oil for metallic debris contamination. If there is metallic debris contamination that is not build debris, or residual debris, and if the quantity is sufficient to make a circle that has a diameter of 0.50 inch (12.700 mm) minimum, the engine is not serviceable. Disassemble the engine and find the source of the debris contamination. R

R 6 If there is metallic debris contamination other than build debris or residual debris in the main oil filter and the filter housing oil, and the debris contamination is not sufficient to make a circle that has a diameter of 0.50 inch (12.700 mm) minimum, do the steps that follow.

a Continue the engine in service. Also, examine the magnetic probes every 25 hours for 200 flight hours.

R b Collect the debris contamination from the probes and do an analysis of the material R within 200 flight hours. If there is debris contamination from bearing or gear material, remove the engine from service, disassemble the engine, and find the source of the material.

R c If the debris contamination is the same or increases in consecutive magnetic probe inspections during the 200 flight hours inspection interval, remove the engine from service. Disassemble the engine to find the R source of the debris contamination.

d If you do not find bearing or gear material, R and if the quantity of debris contamination decreases in consecutive inspections of R the probes during the 200 flight hours inspection interval, return the engine to service.

(7) Chips or flakes. See Figure 805, Figure 806 and Figure 807.

R R R R NOTE: The PWA 107014 Photo Aide (see Conditions D and F) can be used as an aid showing actual photos of conditions which you can find during a MCD inspection.

(a) Description of chips: These are very thick pieces of metal. Usually one surface is a smooth machined surface; the opposite surface is rough and irregular.

(b) Source of chips: Chips from ball and roller bearings are usually smooth and shiny on one side. R This side can show the original honing/grinding process. The opposite side is duller and has a fractured appearance. Chips from gearteeth have one shiny side with machine marks and one side that is smooth and dull.

(c) Description of flakes: Flakes have an irregular shape, but are usually flat and shiny on both sides. You must do an analysis of them to know their source.

(d) Source of flakes: Flakes come from ball bearings, roller bearings, and gearteeth. Flakes from ball and roller bearings are very thin: 0.002 - 0.010 inch (0.051 - 0.254 mm) thick. They usually have an irregular, plate-like shape and have radial cracks. When the flake is cleaned, it is much brighter than other types of debris contamination. Flakes from gearteeth are shiny, long, and thin, and can have an irregular shape. They are usually thicker and not as bright as ball or roller bearing flakes.

(e) Action: If there are five or more flakes or chips on the magnetic probe the engine is not serviceable. Make a spectroscopic analysis of the debris contamination. Refer to Table 801. Disassemble the engine and find the source of the debris contamination.

(f) Combination of chips/flakes, and fines: If a combination of both chips/flakes and fines are collected on the probe, follow the chip/flakes path on Figure 807.

(g) If there are chips or flakes on a probe, but less than five chips or flakes, do the steps that follow:

1. Remove the main oil filter. Refer to 72-00-61, Removal-35 (Task 72-00-61-030-001). Keep the oil that is in the oil filter housing.

2. Flush the filter with Petroleum Solvent P11-027.

3. Strain the solvent through filter paper or clean cloth. Keep the debris contamination for identification.

4. Install a new main oil filter. Refer to 72-00-61, Installation-35 (Task 72-00-61-430-001).

5 Examine the main oil filter and the filter housing oil for debris contamination. If there is metallic debris contamination in the main oil filter and filter housing oil, and the debris contamination is not build debris or residual debris, and the quantity is sufficient to make a circle that has a diameter of 0.50 inch (12.700 mm) minimum, the engine is not serviceable. Disassemble the engine and find the source of the debris contamination.

6 If there is metallic debris contamination in the main oil filter and filter housing oil but it is not build debris or residual debris, and it is not sufficient to cover an area 0.50 inch (12.700 mm) in diameter, do the steps that follow:

- a Continue the engine in service, but do an inspection of the magnetic probes every 25 hours for 200 flight hours.
- b Collect the debris contamination from the magnetic probes and do an analysis of it for bearing or gear material (see Table 801) within 200 flight hours. If there is bearing or gear material, the engine is not serviceable. Disassemble the engine and find the source of the material.
- c If there is no bearing or gear material, and if the quantity of debris contamination decreases in consecutive magnetic probe inspections during the 200 flight hours inspection interval, continue the engine in service.

F. Spectroscopic Analysis Of Chips And Flakes. See Tables 801 and 802.

(1) The objective of this analysis is to obtain a quantitative estimate of the relative concentrations of metallic elements in the chips, a compositional fingerprint that can be compared to elemental profiles of known oil−wetted materials for purposes of R identifying the source of the debris contamination. One of several spectroscopic methods can be used, depending upon the homogeneity and quantity of chips. The methods and advantages/disadvantages of each are listed below:

Spectroscopic Method	Advantages/Disadvantages
Scanning Electron Microscopy/Energy Dispersive X−ray Spectrometry (SEM/EDX)	This technique is particularly useful when the chips appear heterogeneous, since the small diameter of the electron beam allows spatial resolution of areas as small as 0.1 micrometers. Care must be taken when using the technique to sample several areas to avoid the possibility of an unrepresentative analysis.
Inductively Coupled Plasma/Optical Emission Spectrometry (ICP/OES)	This technique is highly accurate and useful when a large quantity (several milligrams) of material is available for analysis. The technique is relatively laborious, however, as the chips must be digested (dissolved) in an acid solution prior to analysis. This method is therefore recommended only when it is desirable to sample a lot of material at one time, or if it is the only equipment available.
Wavelength Dispersive X−ray Fluorescence Spectrometry (WDXRF)	This technique should only be used when a moderate amount of homogeneous material is present on the probe. The advantage of this technique is the great speed with which an analysis can be performed.

Spectroscopic Method	Advantages/Disadvantages
Spark-or Arc-Source Optical Emission Spectrography	This technique is quite laborious, and only semiquantitative. It should only be used when general, non-definitive information is required.

(2) In all of the techniques described above, the best analysis will be obtained when the equipment is calibrated using well-characterized standard materials, similar in composition to the sample. The stability and relative specificity of modern equipment, however, allows some useful information to be gathered with less rigorous calibration. Interpretation of this type of data is difficult, however, and should be carried out only be a trained atomic spectroscopist.

R G. Magnetic Chip Detector Probe Functional Check Procedure

CAUTION: DO NOT PERMIT THE MAGNETS ON THE PROBES
R TO TOUCH EACH OTHER OR THEY CAN BECOME
DEMAGNETIZED.

R (1) Use one of the procedures that follow to do a check of
R the magnetic strength of the probe:

R (a) Preferred method. Have the magnetic probe pick up a 1.00 inch (25.400 mm) diameter carbon steel ball bearing. If the ball bearing is not available, perform the method described in the step that follows.

R (b) Alternate Method. Hang the magnetic probe on a horizontal steel surface so that the magnet has to fully support the weight of the probe.

R (c) If the magnetic probes do not operate correctly, replace the magnetic chip detector assembly.

H. Postrequisites

(1) Install the magnetic probe in the valve. Refer to Installation−36 (Task 72−00−61−450−017).

ENGINE GENERAL - MAIN GEARBOX - INSPECTION/CHECK-05

Task 72-00-61-200-001:

1. Inspect The Main Gearbox For Oil Leaks, Cracks, And Corrosion

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	AR	72-61-00/12/60
Packing	AR	72-61-00/12/240

B. Procedure

WARNING: DO NOT PERMIT ENGINE OIL P03-001 TO TOUCH SKIN OR PAINT FOR A LONG TIME. ENGINE OIL CAN CAUSE DERMATITIS AND SOFTEN PAINT.

(1) Examine the main gearbox, oil pump, and oil tank for oil leaks from the magnetic chip detector assemblies. Refer to Figure 801. If there is a leak, refer to Table 801 for action.

Source Of The Leak	Replace The:
Top of the valve	Probe packing, and, if applicable, the valve packing. Refer to Removal-36 (Task 72-00-61-050-017) and Installation-36 (Task 72-00-61-450-017).
Bottom of the valve	Assembly packing. Refer to Removal-36 (Task 72-00-61-050-017) and Installation-36 (Task 72-00-61-450-017).

Table 801

(2) Examine the drain plugs and thermocouple probe in the main gearbox for leaks. See Figure 802. If there is a leak:

CAUTION: WHEN YOU REMOVE A DRAIN PLUG, HOLD THE BUSHING WITH A WRENCH SO THAT IT DOES NOT TURN.

(a) Remove the plug/probe. Discard the packing. Permit the oil to drain.

(b) Apply Engine Oil P03−001 to a new packing and the threads of the plug/probe.

CAUTION: BE SURE TO INSTALL A PACKING ON THE PLUG/PROBE. IF THERE IS NO PACKING, THE ENGINE CAN LOSE A LARGE QUANTITY OF OIL AND THERE CAN BE AN ENGINE FAILURE.

(c) Put the packing on the plug/probe.

(d) Install the plug/probe in the bushing.

CAUTION: WHEN YOU INSTALL A PLUG/PROBE, HOLD THE BUSHING WITH A WRENCH SO THAT IT DOES NOT TURN.

(e) Torque the plug as shown in Table 802. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

Figure/ Item No.	Torque lb−in. (N.m)
802/1	110 − 120 (12.428 − 13.558)
802/3	150 − 170 (16.948 − 19.207)

Table 802

(f) For (Pre SB PW4ENG 72−84) engines, torque the probe (802/2) to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(g) For (Post SB PW4ENG 72−84) engines, torque the probe (802/2A) as follows:

1 (Reference 571) Remove the lockwire between the adapter and coupling nut. Loosen the coupling nut from the adapter. Torque the adapter (to the housing) to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the adapter to the gearbox lug.

2 Turn the probe so the two larger studs are on the bottom and slightly outward from the engine centerline. See the figure.

3 (Reference 572) Torque the coupling to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 from the coupling nut to the adapter.

(3) Examine the oil tank cap for leaks. If there is a leak from the stem of the cap, replace the packing in the cap. Refer to Removal-38 (Task 72-00-61-040-002) and Installation-38 (Task 72-00-61-440-002).

(4) Examine the main gearbox for cracks. A gearbox with cracks cannot continue in service.

(5) Examine the main gearbox housing for corrosion.

CAUTION: USE THE SPOP 208 WIPE METHOD OF THE Standard Practices Manual, PN 585005, TO IMMEDIATELY REMOVE ANY WET OR BAKED ON HYDRAULIC FLUID FROM THE GEARBOX. HYDRAULIC FLUID CAN CORRODE THE ALUMINUM HOUSING OF THE GEARBOX WHEN UNDER ENGINE OPERATING TEMPERATURES.

(a) Corroded areas that are less than 0.050 inch (0.127 mm) deep are permitted.

(b) If the depth of a corroded area is equal to, but not more than, 0.050 inch (0.127 mm), and has an area less than 1.00 inch^2 (645 mm^2), and is at least 2.00 inches (50.800 mm) away from other corroded areas, the part may continue in service.

(c) Corrosion that is more than the limits above is not permitted and the part may not continue-in-service.

ENGINE GENERAL − MAIN GEARBOX − INSPECTION/CHECK−05

C. Postrequisites

(1) If a plug/probe was removed, service the oil system. Refer to 72−00−00, Servicing−03 (Task 72−00−00−610−003).

ENGINE GENERAL − MAIN GEARBOX − STORAGE−01

Task 72−00−61−530−001:

1. Pack The Main Gearbox

A. Prerequisites

(1) Remove the main gearbox. Refer to 72−00−61, Removal−01 (Task 72−00−61−020−001) or Removal−33 (Task 72−00−61−020−003).

(2) Remove the lubrication and scavenge oil pump. Refer to 72−00−61, Removal−32 (Task 72−00−61−050−014).

(3) Remove the EEC alternator stator. Refer to 72−00−61, Removal−10 (Task 72−00−61−050−007).

(4) Remove the EEC alternator rotor. Refer to 72−00−61, Removal−09 (Task 72−00−61−050−006).

NOTE: Removal of the oil tank is optional. To remove the oil tank, refer to 72−00−61, Removal−28 (Task 72−00−61−050−012).

B. Equipment And Materials Required

Special Tools:
P60041 Shipping Equipment Assembly

C. Procedure

See Figures 1201 and 1202.

(1) If applicable, remove the bolts that attach the cover of the container. Remove the cover.

(2) With a hoist and two slings, lift the detail support of P60041 Shipping Equipment Assembly. Attach the support to the main gearbox clevises with the detail ball lock pins.

(3) With the detail screws, attach the covers to the bores shown in the referenced figure. Install the plugs and and cap where shown.

NOTE: If the oil tank is installed, do not install the cover for that bore.

(4) With the hoist and slings, lift the assembly. Lower the assembly into the detail frame. Attach the support to the detail frame with the detail washers, lockwashers, and screws.

(5) With the detail bolts, attach the cover of the container.

Task 72−00−61−540−001:

2. Unpack The Main Gearbox

A. Equipment And Materials Required − None

B. Procedure

See Figures 1201 and 1202.

(1) Before you remove the bolts that attach the cover of the container, release the pressure inside the container. Use the detail pressure relief valve.

(2) Remove the bolts that attach the cover of the container. Remove the cover.

(3) Remove the eight bolts and washers that attach the detail support to the detail frame of the shipping equipment assembly.

(4) With a hoist and two slings, lift the detail support and main gearbox out of the detail frame. Put the assembly on a pallet.

(5) Remove the detail covers and plugs from the main gearbox.

(6) Remove the three ball lock pins that attach the main gearbox to the detail support. Remove the detail support from the main gearbox.

(7) Attach the detail support to the detail frame. Remove the hoist and slings.

C. Postrequisites

(1) Install the EEC alternator rotor. Refer to 72−00−61, Installation−09 (Task 72−00−61−450−006).

(2) Install the EEC alternator stator. Refer to 72−00−61, Installation−10 (Task 72−00−61−450−007).

(3) Install the lubrication and scavenge oil pump. Refer to 72−00−61, Installation−32 (Task 72−00−61−450−014).

(4) If the oil tank was removed, install the oil tank. Refer to 72−00−61, Installation−28 (Task 72−00−61−450−012).

(5) Install the main gearbox. Refer to 72−00−61, Installation−01 (Task 72−00−61−420−001) or Installation−33 Task 72−00−61−420−003).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-00-62-020-001:

1. Remove The Angle Gearbox

A. Prerequisites

(1) Remove the external plumbing before removal of the angle gearbox. See Removal-02 (Task 72-00-62-020-002).

(2) Remove the fan exit liner segment (inner rear) that is at 6 o'clock. Refer to 72-00-33, Removal-16 (Task 72-00-33-040-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 85518	Puller
PWA 87502	Puller, Knocker (Optional To PWA 101035)
PWA 101035	Puller, Jackscrew (Optional To PWA 87502)
PWA 102830	Adapter

C. Procedure

R NOTE: If the angle gearbox is the source of the metal
R in the system and the failure caused any debris
R larger than a flake (such as a geartooth, washer,
R bolt, bearing part, etc.) then all liberated angle
R gearbox debris larger than a flake must be found.
R If there is any debris larger than a flake that
R is not found, then the main gearbox must also be
R removed and disassembled sufficiently until the
R missing debris is found. Refer to Section 72-00-00,
R Inspection/Check-04 (Task 72-00-00-280-054) for the
R definition of a flake.

(1) Disconnect the gearbox driveshaft and the front housing from the angle gearbox as follows. See Figure 301.

(a) Put a 5 gallon (18.9 l) container under the mating faces of the front housing and angle gearbox. Use it to collect oil.

(b) Remove the bolts that connect the brackets on the front housing to the HPC.

(c) Remove the bolts, washers, and nuts that attach the front housing and brackets to the angle gearbox. Remove the clamp bolt and the two brackets.

(d) Use PWA 102830 Adapter to break loose the front and rear packings on the front housing.

(e) Move the front housing to the rear.

(f) Discard the packing on the front housing.

(g) Remove the retaining ring that attaches the gearbox driveshaft to the angle gearbox.

(h) Move the gearbox driveshaft to the rear.

(2) Remove the fan exit case flange assembly (called flange assembly) as follows. See Figure 302.

(a) Cut the sealant that is at the ends of the flange assembly.

(b) Bend the key at each end of the flange assembly.

(c) Remove and discard the keys.

(d) Remove the flange assembly.

(e) Mechanically remove the sealant that is at the ends of the flange assembly. Remove the sealant that is at the trailing edge of strut platforms No. 5 and 6.

(3) Remove the angle gearbox as follows.

(a) Put a 5 gallon (18.9 l) container under the angle gearbox to collect oil.

(b) Remove the plug from the side of the angle gearbox cover assembly. See Figure 303.

1 Remove the bolts, washers, and plug.

2 Discard the packing.

(c) Remove the gearbox driveshaft assembly as follows. See Figure 304.

R
R

1 Remove the retaining ring that keeps the plug (gearbox cover) in the bottom of the angle gearbox.

2 With PWA 85518 Puller, remove the plug (gearbox cover). Discard the packing.

3 Remove the retaining ring that is inside the angle gearbox. It keeps the gearbox driveshaft assembly in place.

4 Remove the gearbox driveshaft assembly.

(d) Remove the angle gearbox with the PWA 101035 Jackscrew Puller (Optional to PWA 87502 Knocker Puller) as follows. See Figure 305 (Sheet 1).

1 Remove the bolt and pin stop from each support bracket. Discard the pin stops.

2 Remove the two arms of the PWA 101035 Jackscrew Puller from the puller detail bar and attach the two arm assemblies into the angle gearbox brackets on the opposite sides of the angle gearbox with the two detail bolts handtightened.

3 Remove the large jackscrew nut and washer which attach the puller detail bar to the main body bracket of the Jackscrew Puller.

4 Put the main body bracket of the PWA 101035 Jackscrew Puller between the 5th and 6th stage strut of the intermediate case and attach the main body bracket of the puller to the inner strut flanges with the four detail hex head cap screws handtight only.

5 Attach the two detail arm assemblies of the jackscrew puller to the outer position of the puller detail bar and handtighten the two detail bolts to lock the arms in place on the puller detail bar.

6 With the PWA 101035 Jackscrew Puller assembly firmly in place, tighten the two detail bolts which attach the two arm assemblies to the two support brackets. Next, tighten the two detail bolts which attach the arm assemblies to the

outer position of the puller detail bar. Next, tighten the four detail hex head cap screws which attach the puller main body bracket to the inner strut flanges. Next, install the washer and large detail jackscrew nut to the puller detail bar and handtighten.

7 (Pre SB PW4ENG 72-438) Remove the lockwire or safety cable and bolts that attach the two support brackets to the intermediate case.

8 (Post SB PW4ENG 72-438) Un-bend the tabs of the key washers. Remove the bolts that attach the two support brackets to the intermediate case. Remove and discard the key washers.

9 Turn the large detail jackscrew nut to disengage the angle gearbox from the intermediate case. Remove the gearbox with the puller from the intermediate case.

10 Lower the angle gearbox. Install it in a stand.

11 Remove the four detail screws that attach the puller to the two strut flanges.

12 Discard the packing that is on the upper OD of the angle gearbox.

13 If necessary, remove the support brackets from the sides of the angle gearbox.

14 Install protective covers.

(e) Remove the angle gearbox with the PWA 87502 Knocker Puller (optional to PWA 101035 Jackscrew Puller) as follows. See Figure 305 (Sheet 2).

1 Remove the bolt and pin stop from each support bracket. Discard the pin stops.

2 Put the jaws of the PWA 87502 Knocker Puller on the brackets on opposite sides of the angle gearbox.

3 Attach the jaws to the angle gearbox support brackets with the detail bolts. Tighten the two detail bolts.

4 (Pre SB PW4ENG 72-438) Remove the lockwire or safety cable and bolts that attach the two support brackets to the intermediate case.

5 (Post SB PW4ENG 72-438) Unbend the tabs of the key washers. Remove the bolts that attach the two support brackets to the intermediate case. Remove and discard the key washers.

6 Quickly pull the slide hammer against the handle many times until you loosen the angle gearbox from the engine. Remove the gearbox with the puller from the intermediate case.

7 Remove the two detail bolts that attach the puller jaws to the two strut flanges. Remove the puller from the angle gearbox.

8 Put the angle gearbox in a stand.

9 Discard the packing that is on the upper OD of the angle gearbox.

10 If necessary, remove the support bracket at each side of the angle gearbox.

11 Install protective covers.

(4) Remove the gearbox driveshaft and front housing from the main gearbox as follows. See Figure 301.

(a) Pull the gearbox driveshaft and the front housing out of the gearbox driveshaft housing assembly (called rear housing).

(b) Discard the packing that is on the rear of the front housing.

ENGINE GENERAL - ANGLE GEARBOX - REMOVAL-02

Task 72-00-62-020-002:

1. Remove The External Plumbing Prior To The Removal Of The Angle Gearbox

   A. Equipment And Materials Necessary - None

   B. Procedure
   See Figure 301.

      (1) Put a 5 gallon (19 l) container under the angle gearbox connections to collect oil.

      (2) Disconnect the angle-gearbox oil pressure tube assembly (LP09) as follows.

         (a) Remove the lockwire and disconnect the tube nut from the right side angle gearbox adapter.

         (b) Remove the bolts and nuts that attach the tube to brackets. Move the tube to permit angle gearbox removal. Install protection covers.

      (3) Remove the angle-gearbox oil scavenge tube assembly (LR01) as follows.

         (a) Remove the bolts that attach the tube to the rear of the angle gearbox and to the right side of the oil pump.

         (b) Remove the bolts, nuts and clamps that attach the tube to the brackets. Move the tube to permit angle gearbox removal. Remove and discard the packings. Install protection covers.

      (4) For Post SB PW4ENG 75-45 engines, remove the two clamp bolts and nuts that attach the (bottom) hydraulic manifold (CP02) and the (bottom) oil cooler inlet return manifold (CR04) to the angle gearbox bracket.

ENGINE GENERAL - ANGLE GEARBOX - INSTALLATION-01

Task 72-00-62-420-001:

1. Install The Angle Gearbox

A. Prerequisites

(1) See 72-00-62, Inspection/Check-01 (Task 72-00-62-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 Or M307

Special Tools:
PWA 85768 Puller
PWA 87514 Gage, Plug
PWA 87552 Crimper, Finish
PWA 87553 Crimper, Prebend

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-038	Cheesecloth, Unsized (Misc. 0018)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
	P05-292	Ferrule, Safety Cable (Optional)
R	P06-054	Paste, Antiseize (PWA 36246)
	P09-027	Sealant, Silicone Rubber (PWA 36003-2)
	P11-005A	Solvent, Methyl Ethyl Ketone (PMC 1820)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
(CONTINUED)		
Packing	1	72−62−00/6/30
Pin Stop	2	72−00−62/1/10

C. Procedure

(1) Install the gearbox driveshaft and gearbox driveshaft (front) housing assembly (called front housing) in the gearbox driveshaft housing assembly (called rear housing) as follows. See Figure 401.

(a) Install the gearbox driveshaft and retaining ring in the front housing.

(b) Lubricate with Engine Oil P03−001 two new packings. Install the packings in the front and rear grooves of the front housing.

(c) Install the front housing in the rear housing. Move the front housing to the rear.

(d) Engage the splines of the gearbox driveshaft with the splines in the main gearbox. Move the gearbox driveshaft to the rear.

(2) Install the angle gearbox as follows. See Figure 402.

(a) Install the angle gearbox in the intermediate case as follows.

1 Attach a new pin stop to each support bracket with bolts, lubricated with Engine Oil P03−001. Tighten the bolts with your fingers.

2 Install the brackets on the pins at the sides of the angle gearbox.

3 Twist the free end of the stop counterclockwise until it touches the ID of the pin.

4 While you hold the pin stops, torque the bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

5 Bend the keys on the stops.

R
R

6 Lubricate with Engine Oil P03-001 one packing. Install it on the upper OD of the angle gearbox.

7 Put the angle gearbox in position in the intermediate case.

8 Apply Engine Oil P03-001 to the threads of four bolts.

9 (Pre SB PW4ENG 72-438) Attach the angle gearbox with the bolts through the support brackets. Torque the bolts to 225 - 300 lb-in. (25.422 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

10 (Post SB PW4ENG 72-438) Put the two key washers in the correct position against the support brackets. Attach the angle gearbox with the bolts through the key washers and support brackets. Torque the bolts to 275 - 300 lb-in. (31.071 - 33.895 N.m). Bend the tabs of the key washers against the bolts. Use PWA 87553 Crimper. Then use PWA 87552 Crimper.

(b) Install the gearbox driveshaft assembly as follows.

1 Lubricate with Engine Oil P03-001 the splines of the gearbox driveshaft assembly.

2 Put the gearbox driveshaft assembly in position in the angle gearbox mating the splines.

3 Install the retaining ring to keep the gearbox driveshaft assembly in position.

(c) Do a check of the installation of the gearbox driveshaft retaining ring.

1 Install PWA 87514 Gage in the bore of the bevel gear.

2 If the retaining ring is correctly installed, the detail stop bar will touch the bottom of the bevel gear.

(d) Install the plug (gearbox cover) as follows.

ENGINE GENERAL − ANGLE GEARBOX − INSTALLATION−01

1 Lubricate with Engine Oil P03−001 one packing.

2 Install the packing on the plug (gearbox cover).

3 Install the plug (gearbox cover) in the angle gearbox cover assembly.

4 Install the retaining ring in the angle gearbox cover assembly.

(e) Install the plug in the side of the angle gearbox cover assembly. See Figure 403.

1 Lubricate with Engine Oil P03−001 one packing. Install it on the plug.

2 Attach the plug to the angle gearbox cover assembly with two washers and two bolts,
R threads lubricated with Antiseize Paste
R P06−054. Wipe off unwanted paste. Tighten and torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(3) Install the intermediate case parts as follows. See Figure 404.

(a) Install the fan−exit−case−flange−assembly.

1 Install the fan−exit−case−flange−assembly.

2 (Reference 138) Install a key at each end of the fan−exit−case−flange−assembly in the lugs of the struts of the intermediate case. Use the correct class of key. The class of key is correct if there is no empty space between the key and the intermediate case. Refer to the figure.

3 Bend the keys as shown in the figure.

(b) Apply sealant to the ends of the flange assembly and at the trailing edges of the platforms of struts five and six as follows.

1 Clean Areas K and CH. Use a piece of clean Cheesecloth P05−038 that is moist with Solvent P11−005A.

2 Dry the surfaces fully in air that is at room temperature. There must be no solvent on the surfaces when you apply the sealant.

3 Apply Sealant P09−027 where shown. Cure the sealant in air that is at room temperature and has a relative humidity of 25 percent, minimum.

4 Cure the sealant at the struts for two hours, minimum, before you touch it.

5 Cure the sealant at the ends of the flange assembly for eight hours before engine operation.

(4) Connect the gearbox driveshaft and front housing to the angle gearbox as follows. See Figure 401.

(a) Move the gearbox driveshaft forward. Engage the mating splines of the gearbox driveshaft and angle gearbox.

(b) If the splines do not engage, you must turn the gearshaft in the main gearbox as follows. See Figure 405.

1 Remove the two bolts and washers that attach the cover (manual crank) to the main gearbox.

2 Remove the cover (manual crank) with PWA 85768 Puller. Discard the packing.

3 With a standard wrench, turn the gearshaft that is inside.

4 Engage the mating splines of the gearbox driveshaft and the angle gearbox.

5 Lubricate with Engine Oil P03−001 a new packing. Install it on the cover (manual crank).

R
R
6 Lubricate with Antiseize Paste P06−054 two bolts. Wipe off unwanted paste. Attach the cover (manual crank) to the main gearbox with two washers and the two bolts. Torque the bolts to 62 − 72 lb−in. (7.005 − 8.135 N.m).

ENGINE GENERAL - ANGLE GEARBOX - INSTALLATION-01

(c) Install the retaining ring in the angle gearbox to keep the gearbox driveshaft in position. See Figure 401.

R R (d) Lubricate with Antiseize Paste P06-054 the threads of six nuts. Wipe off unwanted paste.

(e) Attach the front housing and two brackets to the angle gearbox with two bolts, two washers, and two of the nuts. Tighten the bolts.

(f) Attach the front housing to the angle gearbox at the other locations with four bolts, eight washers, and four of the nuts. Tighten the bolts.

(g) Attach the brackets on the front housing to the HPC.

1 Lubricate with Engine Oil P03-001 the threads of four bolts.

2 Attach the brackets to the HPC with the four bolts. Tighten the bolts.

3 Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(h) Torque the bolts in the front housing to 62 - 72 lb-in. (7.005 - 8.135 N.m).

(5) Attach the main-bearing-scavenge tube to the bracket as follows.

(a) Lubricate with Engine Oil P03-001 the threads of one bolt.

(b) Attach the tube clamp to the front of the bracket on the front housing with the bolt and a nut. Torque the bolt to 36 - 40 lb-in. (4.067 - 4.519 N.m).

D. Postrequisites

(1) Install the fan exit liner segment (inner rear) that is at 6 o'clock. Refer to 72-00-33, Installation-16 (Task 72-00-33-440-001).

(2) Install the external plumbing to complete the installation of the angle gearbox. See Installation-02 (Task 72-00-62-420-002).

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	2	79-22-00/1/1

B. Procedure
See Figure 401.

(1) Connect angle-gearbox oil pressure tube assembly (LP09) as follows.

(a) Remove the protection covers. Lubricate the tube
R nut threads with Antiseize Paste P06-054. Wipe
R off unwanted paste. Install the tube nut to the
adapter on the right side of the angle gearbox and
tighten by hand.

(b) Install the clamps, bolts, lubricated with Engine Oil P03-001, and nuts that attach the tube to the brackets. Torque all the clamp bolts that attach the tube to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Torque the tube nut to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(2) Install the angle−gearbox oil scavenge tube assembly (LR01) as follows.

(a) Remove the protection covers. Install the two packings, lubricated with Engine Oil P03−001, to the groove at each end of the tube.

(b) Install the tube to the oil−scavenge pump port and to the port on the rear of the angle gearbox. Attach the front end of the tube with two bolts, lubricated with Engine Oil P03−001. Attach the rear end of the tube with two bolts, lubricated
R with Antiseize Paste P06−054. Wipe off unwanted
R paste.

(c) Install the clamps, bolts, lubricated with Engine Oil P03−001, and nuts that attach the tube to the brackets. Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(d) Torque the bolts at the front end of the tube to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(e) Torque the bolts at the rear end of the tube to 62 − 72 lb−in. (7.005 − 8.135 N.m).

(3) For Post SB PW4ENG 75−45 engines, install the clamps, bolts, threads lubricated with Engine Oil P03−001, and nut that attach the (bottom) hydraulic manifold (CP02) and the oil cooler inlet return manifold (CR04). Torque the clamp bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

ENGINE GENERAL - ANGLE GEARBOX - INSPECTION/CHECK-01

Task 72-00-62-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of

	actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions
- (1) Dimensions are provided in this column for reference only.
- (2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits
- (1) Limits applicable to any combination of new or used parts.
  - (a) This column provides the acceptable (minimum - maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.
  - (b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.
  - (c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1:

Ref. No.	IFR	Description	New Part Reference Dimensions Min	− Max	Limits Min	− Max
1812		Bearing ------	0.508 (12.903)	0.512 (13.005)		
		Support ------	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (−) 0.512 = .005
(13.131) (13.005) (0.126)

.527 (−) .508 = .019
(13.385) (12.903) (0.482)

EXAMPLE 2:

Ref. No.	IFR	Description	New Part Reference Dimensions Min	− Max	Limits Min	− Max
1812		Bearing ------	0.508 (12.903)	0.512 (13.005)		
		Support ------	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk (*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3:

Ref. No.	I F R	Description	New Part Reference Dimensions Min	− Max	Limits Min	− Max
1812		Bearing ------	0.508 (12.903)	0.512 (13.005)		
		Support ------	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

ENGINE GENERAL - ANGLE GEARBOX - INSPECTION/CHECK-02

Task 72-00-62-210-001:

1. Examine The Angle Gearbox For Cracks, Oil Leaks, And Corrosion
   - A. Equipment And Materials Required - None
   - B. Procedure
     - (1) Examine the angle gearbox for cracks, oil leaks, and corrosion. Refer to Table 801.

Examine	Serviceable Limits	Not Serviceable
All surfaces for:		
Cracks		Any quantity
Oil Leaks		Any quantity
Corrosion		
Depth	0.050 or less (0.127)	More than 0.050 (0.127)
Area	Any quantity less than 1.00 inch^2 (645 mm^2)	
Separation	Any quantity 2.000 or more (50.800)

Pratt & Whitney

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

TO: RECIPIENTS OF PW4152, PW4152-3, PW4156A, PW4156A-3,
PW4158, PW4158-3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 83 DATED MAY 1, 2007

HIGHLIGHTS - ENGINE GENERAL - LPC/LPT COUPLING

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72-00-32 REMOVAL-03	302 305 311/ 312	Added the PWA 101263 Protector in the text and related figure. Renumbered steps. (TDS101263)	ALL
72-00-32 INSTALL-01	409 428	Revised the text to add a step to loosen the PWA 88222 Retainer. Revised the related figure. (CACTUSR7031-Q56541)	ALL

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

TO: RECIPIENTS OF PW4152, PW4152-3, PW4156A, PW4156A-3,
PW4158, PW4158-3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 82 DATED DECEMBER 15, 2006

HIGHLIGHTS - ENGINE GENERAL - FAN CASE

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72-00-33 REMOVAL-01	301	Updated Task Reference numbers. (editorial)	4152 4156A 4158
72-00-33 REMOVAL-01	301	Updated Task Reference number. (editorial)	4152-3 4156A-3 4158-3
72-00-33 REMOVAL-08	301	Updated Task Reference numbers. (editorial)	ALL
72-00-33 INSTALL-01	414	Updated Task Reference numbers. (editorial)	ALL
72-00-33 INSTALL-08	403	Updated Task Reference number and Section number. (editorial)	ALL
72-00-33 INSP/CHK-01	806 -807	Updated Task Reference numbers. (editorial)	ALL
72-00-33 INSP/CHK-04	801 -802 804	Updated Task Reference number. Updated Figure reference number. (editorial)	ALL

CHAPTER 72

ENGINE GENERAL - FAN CASE

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - FAN CASE	72-00-33		
Removal-01		301	4152 4156A 4158
Task 72-00-33-020-001: Remove Fan Case		301	
Removal-01		301	4152-3 4156A-3 4158-3
Task 72-00-33-020-006: Remove Fan Case		301	
Removal-02		301	ALL
Task 72-00-33-020-003-A: Remove Fan Case Plumbing For Engines With Basic Parts		301	
Task 72-00-33-020-003-B: Remove Fan Case Plumbing For Engines With Commonality Parts Between Airbus And McDonnell Douglas		303	
Removal-03		301	ALL
Task 72-00-33-020-002-A: Remove Front Fan Case For Basic Engines		301	
Task 72-00-33-020-002-B: Remove Front Fan Case For Engines With The Airbus/McDonnell Douglas Common Parts Configuration		304	
Removal-04		301	ALL
Task 72-00-33-050-001: Remove Electronic Engine Control		301	
Removal-05		301	ALL
Task 72-00-33-050-002: Remove The No. 3 Bearing Air Cooler Assembly		301	
Removal-06		301	ALL
Task 72-00-33-050-003-A: Remove EEC Fan Case Wiring Harnesses W1 And W2 For Basic Engines		301	
Task 72-00-33-050-003-B: Remove EEC Fan Case Wiring Harnesses W1, W2, W11 (SCU Only) And W12 For Engines With Commonality Parts Between Airbus and McDonnell Douglas		315	
Removal-07		301	ALL

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - FAN CASE (CONTINUED)	72-00-33		
Task 72-00-33-020-005: Remove Bleed Valve Assembly		301	
Removal-08		301	ALL
Task 72-00-33-020-004: Remove The Fan Exit Base And Vane Assemblies		301	
Removal-09		301	ALL
Task 72-00-33-050-004: Remove Propulsion Multiplexer Unit (PMUX)		301	
Removal-10		301	ALL
Task 72-00-33-050-005: Remove PMUX Programming Plug		301	
Removal-11		301	ALL
Task 72-00-33-050-006: Remove 2.5 Bleed Valve Actuator		301	
Removal-12		301	ALL
Task 72-00-33-050-007-A: Remove The EEC Programming Plug For Basic Engines		301	
Task 72-00-33-050-007-B: Remove The EEC Programming Plug For Engines With Commonality Parts Between Airbus And McDonnell Douglas		301	
Removal-13		301	ALL
Task 72-00-33-050-008: Remove The Supplemental Control Unit		301	
Removal-14		301	ALL
Task 72-00-33-050-009: Remove The Fan Exit (Bifurcation) Fairing Assemblies (Pre SB PW4ENG 72-370)		301	
Task 72-00-33-050-009-A: Remove The Fan Exit (Bifurcation) Fairing Assemblies (Post SB PW4ENG 72-370)		307	
Removal-15		301	ALL
Task 72-00-33-050-010: Remove The Supplemental Control Unit (SCU) Programming Plug		301	
Removal-16		301	ALL
Task 72-00-33-040-001: Remove The Fan Exit Liner Segment Assemblies (Procedure To Use With The Removal Of A Component)		301	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - FAN CASE (CONTINUED)	72-00-33		
Removal-17		301	ALL
Task 72-00-33-040-002: Remove A Fan Exit Liner Seal		301	
Removal-20		301	ALL
Task 72-00-33-020-020: Remove The Flange C Brackets And Hardware		301	
Installation-01		401	ALL
Task 72-00-33-420-001: Install Fan Case		401	
Installation-02		401	ALL
Task 72-00-33-420-003-A: Install Fan Case Plumbing For Basic Engines		401	
Task 72-00-33-420-003-B: Install Fan Case Plumbing For Engines With The Airbus/McDonnell Douglas Common Parts Configuration		405	
Installation-03		401	ALL
Task 72-00-33-420-002-A: Install Front Fan Case For Basic Engines		401	
Task 72-00-33-420-002-B: Install Front Fan Case For Engines With The Airbus/McDonnell Douglas Common Parts Configuration		405	
Installation-04		401	ALL
Task 72-00-33-450-001: Install Electronic Engine Control		401	
Installation-05		401	ALL
Task 72-00-33-450-002: Install The No. 3 Bearing Air Cooler Assembly		401	
Installation-06		401	ALL
Task 72-00-33-450-003-A: Install EEC Fan Case Wiring Harnesses W1 and W2 For Basic Engines		401	
Task 72-00-33-450-003-B: Install EEC Fan Case Wiring Harnesses W1, W2, W11 (SCU only) And W12 For Engines With Airbus/McDonnell Douglas Common Parts Configuration		424	
Installation-07		401	ALL
Task 72-00-33-420-005:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - FAN CASE (CONTINUED)	72-00-33		
Install Bleed Valve Assembly		401	
Installation-08		401	ALL
Task 72-00-33-420-004: Install The Fan Exit Base And Vane Assemblies		401	
Installation-09		401	ALL
Task 72-00-33-450-004: Install Propulsion Multiplexer Unit (PMUX)		401	
Installation-10		401	ALL
Task 72-00-33-450-005: Install PMUX Programming Plug		401	
Installation-11		401	ALL
Task 72-00-33-450-006: Install 2.5 Bleed Valve Actuator		401	
Installation-12		401	ALL
Task 72-00-33-450-007-A: Install The EEC Programming Plug		401	
Task 72-00-33-450-007-B: Install The EEC Programming Plug For Engines With Commonality Parts Between Airbus And McDonnell Douglas		403	
Installation-13		401	ALL
Task 72-00-33-450-008: Install The Supplemental Control Unit		401	
Installation-14		401	ALL
Task 72-00-33-450-009: Install The Fan Exit (Bifurcation) Fairing Assemblies (Pre SB PW4ENG 72-370)		401	
Task 72-00-33-450-009-A: Install The Fan Exit (Bifurcation) Fairing Assemblies (Post SB PW4ENG 72-370)		412	
Installation-15		401	ALL
Task 72-00-33-450-010: Install The Supplemental Control Unit (SCU) Programming Plug		401	
Installation-16		401	ALL
Task 72-00-33-440-001: Install The Fan Exit Liner Segment Assemblies (Procedure To Use With The Installation Of A Component)		401	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - FAN CASE	72-00-33		
(CONTINUED)			
Installation-17		401	4152-3
Task 72-00-33-440-002:			4156A-3
Install A Fan Exit Liner Seal		401	4158-3
Installation-18		401	4152 4156A
Task 72-00-33-440-004:			4158
Install Fan Exit Liner Seal (Engines With Seal Installed To Inner Fan Exit Case Assembly)		401	
Installation-20		401	ALL
Task 72-00-33-420-020:			
Install The Flange C Brackets And Hardware		401	
Inspection/Check-01		801	ALL
Task 72-00-33-990-001:			
Specific Fits And Clearances		801	
Inspection/Check-02		801	ALL
Task 72-00-33-210-001:			
Inspect Electronic Engine Control (EEC) Water Traps		801	
Inspection/Check-03		801	ALL
Task 72-00-33-210-002:			
Inspect The Intercompressor (2.5) Bleed System		801	
Inspection/Check-04		801	ALL
Task 72-00-33-210-003:			
Examine The Sealant At The Bifurcation Fairing		801	
Inspection/Check-05		801	ALL
Task 72-00-33-210-004:			
Do A Check Of The Clearance Between The Trailing Edges Of The Fan Exit (Front) Liner Segment Assemblies And The (Rear) Liner Segment Assemblies		801	
Inspection/Check-10		801	ALL
Task 72-00-33-210-010:			
Fan Case Module Assembly Visual Inspection		801	
Repair-01		901	ALL
Task 72-00-33-300-001-001:			
Repair The Sealant Around The Bifurcation Fairing (Pre SB PW4ENG 72-370)		901	
Task 72-00-33-300-001-002:			
Repair The Sealant Around The Bifurcation Fairing (Post SB PW4ENG 72-370)		902	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL − FAN CASE (CONTINUED)	72−00−33		
Repair−02		901	ALL
Task 72−00−33−300−002: Install Boltholes In The Replacement Access Covers		901

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Engine General - Intermediate Case

List of Effective Pages - Engine General - Intermediate Case

See end of list.

CHAPTER 72

ENGINE GENERAL - INTERMEDIATE CASE

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - INTERMEDIATE CASE	72-00-34		
Removal-01		301	ALL
Task 72-00-34-020-001: Remove Intermediate Case		301	
Removal-02		301	ALL
Task 72-00-34-020-002: Remove External Plumbing For Intermediate Case Removal		301	
Removal-03		301	ALL
Task 72-00-34-050-001: Remove Electronic Engine Control (EEC) Speed Transducer (N1)		301	
Removal-04		301	ALL
Task 72-00-34-050-002: Remove No. 1 Bearing Support (Front And Rear) Assembly		301	
Removal-05		301	ALL
Task 72-00-34-050-003: Remove EEC Fan Case Wiring Harnesses W1 And W2 - Relocated		301	
Task 72-00-34-050-004: Remove EEC Core Engine Wiring Harnesses W3, W4 And W5 - Relocated		301	
Removal-06		301	ALL
Task 72-00-34-030-001: Remove No. 1.5 Bearing Support Assembly		301	
Removal-07		301	ALL
Task 72-00-34-030-002: Remove The 4th Stage Compressor Stator Assembly		301	
Removal-08		301	ALL
Task 72-00-34-050-005: Remove Air/Oil Heat Exchanger And Valve (IDGS)		301	
Removal-09		301	ALL
Task 72-00-34-050-006: Remove Valve From Air/Oil Heat Exchanger (IDGS)		301	
Removal-10		301	ALL
Task 72-00-34-050-007:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - INTERMEDIATE CASE (CONTINUED)	72-00-34		
Remove Air/Oil Heat Exchanger And Valve (Engine)		301	
Removal-11		301	ALL
Task 72-00-34-050-008:			
Remove Valve From Air/Oil Heat Exchanger (Engine)		301	
Removal-12		301	4152 4156A 4158
Task 72-00-34-050-009:			
Remove HPC Secondary Flow Control Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid		301	
Removal-13		301	ALL
Task 72-00-34-050-010:			
Remove The Start/Stability Bleed Valve Solenoid		301	
Removal-14		301	4152 4156A 4158
Task 72-00-34-050-011:			
Remove HPC Secondary Flow Control Valve, Turbine Vane And Blade Cooling Air Valve Solenoid		301	
Removal-15		301	ALL
Task 72-00-34-050-012:			
Remove IDGS Air/Oil Heat Exchanger Valve Override Pressure Switch		301	
Removal-16		301	ALL
Task 72-00-34-050-013:			
Remove The Stability Bleed Pneumatic Relay Valve		301	
Removal-17		301	ALL
Task 72-00-34-050-014:			
Remove EEC Speed Transducer (N1) Multiplexer Input Probe		301	
Removal-18		301	ALL
Task 72-00-34-050-018:			
Remove EEC Wiring Harness - W3 (Core Engine)		301	
Removal-19		301	ALL
Task 72-00-34-050-019:			
Remove EEC Wiring Harness - W4 (Core Engine)		301	
Removal-20		301	ALL
Task 72-00-34-020-020:			
Remove The Flange E Brackets And Hardware		301	
Removal-21		301	CONFIG-1 4152 4156A 4158
Task 72-00-34-020-004:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL – INTERMEDIATE CASE (CONTINUED)	72-00-34		
Remove The Fan Unit From The Core Engine		301	
Removal-21		301	CONFIG-2
Task 72-00-34-020-006: Remove The Fan Unit From The Core Engine		301	4152-3 4156A-3 4158-3
Removal-22		301	ALL
Task 72-00-34-040-001: Remove The No. 1 Bearing Vibration Transducer		301	
Removal-23		301	CONFIG-1
Task 72-00-34-050-020: Remove EEC Wiring Harness – W5 (Core Engine)		301	4152 4156A 4158
Removal-23		301	CONFIG-2
Task 72-00-34-050-024: Remove EEC Wiring Harness – W5 (Core Engine)		301	4152-3 4156A-3 4158-3
Removal-24		301	4152-3 4156A-3 4158-3
Task 72-00-34-050-022: Remove Turbine Vane And Blade Cooling Air Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid		301	
Removal-25		301	4152-3 4156A-3 4158-3
Task 72-00-34-050-023: Remove Turbine Vane Cooling Air Valve, Turbine Vane And Blade Cooling Air Valve Solenoid		301	
Installation-01		401	ALL
Task 72-00-34-420-001: Install The Intermediate Case		401	
Installation-02		401	ALL
Task 72-00-34-420-002: Install External Plumbing After Intermediate Case Installation		401	
Installation-03		401	ALL
Task 72-00-34-450-001: Install Electronic Engine Control (EEC) Speed Transducer (N1)		401	
Installation-04		401	ALL
Task 72-00-34-450-002: Install No. 1 Bearing Support (Front And Rear) Assembly		401	
Installation-05		401	ALL
Task 72-00-34-990-002:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - INTERMEDIATE CASE (CONTINUED)	72-00-34		
Install EEC Fan Case Wiring Harnesses W1 And W2 - Relocated		401	
Task 72-00-34-450-003: Install EEC Core Engine Wiring Harnesses W3, W4 And W5 - Relocated		401	
Installation-06		401	ALL
Task 72-00-34-430-001: Install No. 1.5 Bearing Support Assembly		401	
Installation-07		401	ALL
Task 72-00-34-430-002: Install The 4th Stage Compressor Stator Assembly		401	
Installation-08		401	ALL
Task 72-00-34-450-004: Install Air/Oil Heat Exchanger And Valve (IDGS)		401	
Installation-09		401	ALL
Task 72-00-34-450-005: Install Valve To Air/Oil Heat Exchanger (IDGS)		401	
Installation-10		401	ALL
Task 72-00-34-450-006: Install Air/Oil Heat Exchanger And Valve (Engine)		401	
Installation-11		401	ALL
Task 72-00-34-450-007: Install Valve To Air/Oil Heat Exchanger (Engine)		401	
Installation-12		401	ALL
Task 72-00-34-450-008: Install HPC Secondary Flow Control Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid		401	
Installation-13		401	ALL
Task 72-00-34-450-009: Install Start/Stability Bleed Valve Solenoid		401	
Installation-14		401	ALL
Task 72-00-34-450-010: Install HPC Secondary Flow Control Valve, Turbine Vane And Blade Cooling Air Valve Solenoid		401

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - INTERMEDIATE CASE (CONTINUED)	72-00-34		
Install IDGS Air/Oil Heat Exchanger Valve Override Pressure Switch		401	
Installation-16		401	ALL
Task 72-00-34-450-012: Install The Stability Bleed Pneumatic Relay Valve		401	
Installation-17		401	ALL
Task 72-00-34-450-013: Install EEC Speed Transducer (N1) Multiplexer Input Probe		401	
Installation-18		401	ALL
Task 72-00-34-450-017: Install EEC Wiring Harness - W3 (Core Engine)		401	
Installation-19		401	ALL
Task 72-00-34-450-018: Install EEC Wiring Harness - W4 (Core Engine)		401	
Installation-20		401	ALL
Task 72-00-34-420-020: Install The Flange E Brackets And Hardware		401	
Installation-21		401	CONFIG-1 4152 4156A 4158
Task 72-00-34-420-004: Install The Fan Unit On The Core Engine		401	
Installation-21		401	CONFIG-2 4152-3 4156A-3 4158-3
Task 72-00-34-420-006: Install The Fan Unit On The Core Engine		401	
Installation-22		401	ALL
Task 72-00-34-440-001: Install The No. 1 Bearing Vibration Transducer		401	
Installation-23		401	CONFIG-1 4152 4156A 4158
Task 72-00-34-450-019: Install EEC Wiring Harness - W5 (Core Engine)		401	
Installation-23		401	CONFIG-2 4152-3 4156A-3 4158-3
Task 72-00-34-450-023: Install EEC Wiring Harness - W5 (Core Engine)		401	
Installation-24		401	4152-3 4156A-3 4158-3
Task 72-00-34-450-021:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - INTERMEDIATE CASE (CONTINUED)	72-00-34		
Install Turbine Vane And Blade Cooling Air Valve, IDGS Air/Oil Heat Exchanger Valve Override Solenoid		401	
Installation-25		401	4152-3 4156A-3 4158-3
Task 72-00-34-450-022: Install Turbine Vane Cooling Air Valve, Turbine Vane And Blade Cooling Air Valve Solenoid		401	
Inspection/Check-01		801	ALL
Task 72-00-34-990-001: Specific Fits And Clearances		801	
Inspection/Check-10		801	ALL
Task 72-00-34-990-010: Intermediate Case Module Assembly Visual Inspection		801	
Repair-01		901	ALL
Task 72-00-34-300-001: Install Helical Coil Inserts In The Screw Thread Inserts In The Ground Handling Pad		901	
Repair-02		901	ALL
Task 72-00-34-300-002: Replace The Screw Thread Inserts In The Ground Handling Pad		901	
Repair-03		901	4152 4156A 4158
Task 72-00-34-300-003: Replace Or Bond An Intermediate Case Strut Seal		901

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Engine General - High Pressure Compressor (HPC)

List of Effective Pages - Engine General - High Pressure Compressor (HPC)
See end of list.

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

TO: RECIPIENTS OF PW4152, PW4152-3, PW4156A, PW4156A-3,
PW4158, PW4158-3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 84 DATED SEPTEMBER 1, 2007

HIGHLIGHTS - ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC)

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72-00-35 REMOVAL-02	302 -304 307 309	Revised the Special Tools list, text and related figure to add the PWA 106364 Adapter. Revised the text editorially concerning PWA 85368. (TDS106364)	ALL
72-00-35 INSTALL-02	402 -404 408 410	Revised the Special Tools list, text and related figure to add the PWA 106364 Adapter. Revised the text editorially concerning PWA 85368. (TDS106364)	ALL

CHAPTER 72

ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC)

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC)	72-00-35		
Removal-01		301	ALL
Task 72-00-35-020-001: Remove The HPC		301	
Removal-02		301	ALL
Task 72-00-35-020-001-002: Remove The No. 2 Bearing Seal Seat - Horizontal		301	
Removal-03		301	ALL
Task 72-00-35-020-002: Remove External Plumbing From High Pressure Compressor		301	
Removal-04		301	ALL
Task 72-00-35-050-001-A: Remove Fuel/Oil Cooler - For Engines Not Equipped With Front Split Mount Bracket (Pre SB PW4ENG 79-20)		301	
Task 72-00-35-050-001-B: Remove Fuel/Oil Cooler - For Engines Equipped With Front Split Mount Bracket (Post SB PW4ENG 79-20)		305	
Removal-05		301	ALL
Task 72-00-35-050-002: Remove Turbine Case Cooling (TCC) Air Valve Actuator		301	
Removal-06		301	4152 4156A 4158
Task 72-00-35-050-003: Remove Turbine Vane And Blade Cooling Air Valve Position Switch		301	
Removal-07		301	ALL
Task 72-00-35-050-005: Remove Turbine Vane And Blade Cooling Air Valve (Right)		301	
Removal-08		301	ALL
Task 72-00-35-050-004: Remove Turbine Vane And Blade Cooling Air Valve (Left)		301	
Removal-09		301	4152 4156A 4158
Task 72-00-35-050-006: Remove HPC Secondary Flow Control Valve (Left)		301	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) (CONTINUED)	72-00-35		
Removal-10		301	4152 4156A 4158
Task 72-00-35-050-007: (Pre SB PW4ENG 72-756) Remove HPC Secondary Flow Control Valve (Right)		301	
Removal-11		301	ALL
Task 72-00-35-050-008: Remove Fuel/Oil Cooler Bypass Valve		301	
Removal-12		301	ALL
Task 72-00-35-050-009: Remove 9th Stage Start/Stability (2.9) Bleed Valve (Upper Left)		301	
Removal-13		301	ALL
Task 72-00-35-050-010: Remove 9th Stage Start/Stability (2.9) Bleed Valve (Upper Right)		301	
Removal-14		301	ALL
Task 72-00-35-050-011: Remove Engine Fuel/Oil Cooler Bypass Valve Solenoid		301	
Removal-15		301	ALL
Task 72-00-35-050-012: Remove Variable Stator Vane Actuator		301	
Removal-16		301	ALL
Task 72-00-35-050-013: Remove PS3 Air Filters		301	
Removal-17		301	ALL
Task 72-00-35-050-014: Remove The 9th Stage Start/ Stability (2.9) Bleed Valve Thermocouple		301	
Removal-18		301	ALL
Task 72-00-35-030-001: Remove The Upper Half Of The HPC Front Case For Access To The 5th Through 8th Stage Blades		301	
Removal-19		301	ALL
Task 72-00-35-030-002: Remove The 5th Through 8th Stage Blades (Quick HPC Blade Change)		301	
Removal-20		301	ALL
Task 72-00-35-050-015: Remove The (2.9) Bleed Valve Screen		301	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) (CONTINUED)	72-00-35		
Removal-21		301	4152-3 4156A-3 4158-3
Task 72-00-35-050-016: Remove Turbine Vane Cooling Air Valve		301	
Installation-01		401	ALL
Task 72-00-35-420-001: Install The HPC		401	
Installation-02		401	ALL
Task 72-00-35-420-001-002: Install The No. 2 Bearing Seal Seat - Horizontal		401	
Installation-03		401	ALL
Task 72-00-35-420-002: Install External Plumbing To High Pressure Compressor		401	
Installation-04		401	ALL
Task 72-00-35-450-001-A: Install Fuel/Oil Cooler - For Engines Not Equipped With Front Split Mount Bracket (Pre SB PW4ENG 79-20)		401	
Task 72-00-35-450-001-B: Install Fuel/Oil Cooler - For Engines Equipped With Front Split Mount Bracket (Post SB PW4ENG 79-20)		411	
Installation-05		401	ALL
Task 72-00-35-450-002: Install Turbine Case Cooling (TCC) Air Valve Actuator		401	
Installation-06		401	4152 4156A 4158
Task 72-00-35-450-003: Install Turbine Vane And Blade Cooling Air Valve Position Switch		401	
Installation-07		401	ALL
Task 72-00-35-450-004: Install Turbine Vane And Blade Cooling Air Valve (Right)		401	
Installation-08		401	ALL
Task 72-00-35-450-005: Install Turbine Vane And Blade Cooling Air Valve (Left)		401	
Installation-09		401	4152 4156A 4158
Task 72-00-35-450-006: Install HPC Secondary Flow Control Valve (Left)		401	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) (CONTINUED)	72-00-35		
Installation-10		401	4152 4156A 4158
Task 72-00-35-450-007: (Pre SB PW4ENG 72-756) Install HPC Secondary Flow Control Valve (Right)		401	
Installation-11		401	ALL
Task 72-00-35-450-008: Install Fuel/Oil Cooler Bypass Valve		401	
Installation-12		401	ALL
Task 72-00-35-450-009: Install 9th Stage Start/Stability (2.9) Bleed Valve (Upper Left)		401	
Installation-13		401	ALL
Task 72-00-35-450-010: Install 9th Stage Start/Stability (2.9) Bleed Valve (Upper Right)		401	
Installation-14		401	ALL
Task 72-00-35-450-011: Install Engine Fuel/Oil Cooler Bypass Valve Solenoid		401	
Installation-15		401	ALL
Task 72-00-35-450-012: Install Variable Stator Vane Actuator		401	
Installation-16		401	ALL
Task 72-00-35-450-013: Install PS3 Air Filters		401	
Installation-17		401	ALL
Task 72-00-35-450-014: Install The 9th Stage Start/Stability (2.9) Bleed Valve Thermocouple		401	
Installation-18		401	ALL
Task 72-00-35-430-001: Install The Upper Half Of The HPC Front Case After Accessing The 5th Through 8th Stage Blades		401	
Installation-19		401	ALL
Task 72-00-35-430-002: Install The 5th Through 8th Stage HPC Blades (Quick HPC Blade Change)		401	
Installation-20		401	ALL
Task 72-00-35-450-015: Install The (2.9) Bleed Valve Screen		401	

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - HIGH PRESSURE COMPRESSOR (HPC) (CONTINUED)	72-00-35		
Installation-21		401	4152-3 4156A-3 4158-3
Task 72-00-35-450-016: Install Turbine Vane Cooling Air Valve		401	
Inspection/Check-01		801	ALL
Task 72-00-35-990-001: Specific Fits And Clearances		801	
Inspection/Check-02		801	ALL
Task 72-00-35-210-001: Inspect Variable Stator Vane Control System		801	
Inspection/Check-03		801	ALL
Task 72-00-35-210-002: Inspect HPC Secondary Flow Control Valve System		801	
Inspection/Check-04		801	ALL
Task 72-00-35-210-004: Inspect HPC Rear Drum OD Thrust Balance Seal		801	
Repair-01		901	ALL
Task 72-00-35-300-001: Blend Repair Of Stage 5, 6 And 7 Rotor Blades For A Fully Built HPC Module - Axial Compressor Rotor Assembly		901

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

TO: RECIPIENTS OF PW4152, PW4152−3, PW4156A, PW4156A−3,
PW4158, PW4158−3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 85 DATED JANUARY 1, 2008

HIGHLIGHTS − ENGINE GENERAL − HIGH PRESSURE TURBINE (HPT)

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72−00−52 INSP/CHK−03	801 −811/ 812	Added a new permeability inspection check for internal sulfidation distress. (IEN07KC498)	ALL
72−00−52 INSP/CHK−10	804	Revised to add a new permeability inspection requirement. (IEN07KC498)	ALL

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Engine General - Low Pressure Turbine (LPT)

List of Effective Pages - Engine General - Low Pressure Turbine (LPT)
See end of list.

TO: RECIPIENTS OF PW4152, PW4152−3, PW4156A, PW4156A−3,
PW4158, PW4158−3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 83 DATED MAY 1, 2007

HIGHLIGHTS − ENGINE GENERAL − LOW PRESSURE TURBINE (LPT)

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72−00−53 INSP/CHK−02	801/ 802	Revised the full procedure and added reference to Inspection/Check−10. (IEN05KC663)	ALL
72−00−53 INSP/CHK−10	801 −847/ 848	Added inspection/check−10 for visual inspection of module assembly. (IEN05KC663, PSAF05KC663B)	ALL

CHAPTER 72

ENGINE GENERAL − LOW PRESSURE TURBINE (LPT)

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL − LOW PRESSURE TURBINE (LPT)	72−00−53		
Removal−01		301	ALL
Task 72−00−53−020−001: Remove Low Pressure Turbine With Shaft		301	
Removal−02		301	ALL
Task 72−00−53−020−001−002: Remove Low Pressure Turbine With Shaft (Hydraulic Wrench) − Deleted		301	
Removal−03		301	ALL
Task 72−00−53−020−003: Remove External Plumbing Prior To Low Pressure Turbine Removal		301	
Removal−04		301	ALL
Task 72−00−53−050−002: Remove Turbine Case Cooling Manifold (Collector)		301	
Removal−05		301	ALL
Task 72−00−53−050−003: Remove Turbine Case Cooling Manifolds		301	
Removal−06		301	ALL
Task 72−00−53−050−004: Remove Turbine Case Cooling (TCC) Air Valve Control Cable		301	
Removal−07		301	ALL
Task 72−00−53−050−001: Remove Turbine Case Cooling (TCC) Air Valve (LPT)		301	
Removal−08		301	ALL
Task 72−00−53−020−002: Remove Low Pressure Turbine And Turbine Exhaust Case With Shaft		301	
Removal−09		301	ALL
Task 72−00−53−020−002−002: Remove The Low Pressure Turbine And Turbine Exhaust Case With Shaft (Hydraulic Wrench) − Deleted		301	
Removal−20		301	ALL
Task 72−00−53−020−020:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL – LOW PRESSURE TURBINE (LPT) (CONTINUED)	72-00-53		
Remove The Flange N Brackets And Hardware		301	
Installation-01		401	ALL
Task 72-00-53-420-001: Install The Low Pressure Turbine With Shaft		401	
Installation-02		401	ALL
Task 72-00-53-420-001-002: Install The Low Pressure Turbine With Shaft (Hydraulic Wrench) – Deleted		401	
Installation-03		401	ALL
Task 72-00-53-420-003: Install External Plumbing After Low Pressure Turbine Installation		401	
Installation-04		401	ALL
Task 72-00-53-450-002: Install Turbine Case Cooling Manifold (Collector)		401	
Installation-05		401	ALL
Task 72-00-53-450-003: Install Turbine Case Cooling (TCC) LPT Manifolds		401	
Installation-06		401	ALL
Task 72-00-53-450-004: Install Turbine Case Cooling (TCC) Air Valve Control Cable		401	
Installation-07		401	ALL
Task 72-00-53-450-001: Install Turbine Case Cooling (TCC) Air Valve (LPT)		401	
Installation-08		401	ALL
Task 72-00-53-420-002: Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft		401	
Installation-09		401	ALL
Task 72-00-53-420-002-002: Install The Low Pressure Turbine And Turbine Exhaust Case With Shaft (Hydraulic Wrench) Deleted		401	
Installation-20		401	ALL
Task 72-00-53-420-020: Install The Flange N Brackets And Hardware		401	
Inspection/Check-01		801	ALL
Task 72-00-53-990-001:			

	SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
	ENGINE GENERAL - LOW PRESSURE TURBINE (LPT) (CONTINUED)	72-00-53		
	Specific Fits And Clearances		801	
	Inspection/Check-02		801	ALL
	Task 72-00-53-200-002: Visually Inspect Low Pressure Turbine		801	
	Inspection/Check-03		801	ALL
	Task 72-00-53-200-003: Inspect Front Compressor Drive Turbine (LPT) Shaft Splines		801	
R	Inspection/Check-10		801	ALL
R	Task 72-00-53-210-010: Visually Examine The Low Pressure Turbine (LPT) Module Assembly - Engine General		801	
	Repair-01		901	ALL
	Task 72-00-53-300-001: Stop Drill Repair Turbine Case Front Inner Rail Cracks		901	
	Repair-02		901	ALL
	Task 72-00-53-300-002: In Situ Featherseal Replacement For Assembled LPT Module - 3rd Stage LPT Outer Transition Duct Assembly		901

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Engine General - Turbine Exhaust Case

List of Effective Pages - Engine General - Turbine Exhaust Case
See end of list.

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

TO: RECIPIENTS OF PW4152, PW4152−3, PW4156A, PW4156A−3,
PW4158, PW4158−3 ENGINE MANUAL, PART NUMBER 50A443

REVISION NO. 82 DATED DECEMBER 15, 2006

HIGHLIGHTS − ENGINE GENERAL − TURBINE EXHAUST CASE

CHAPTER/ SECTION	PAGE NO	DESCRIPTION OF CHANGE	EFFECT OF CHANGE
72−00−54 INSTALL−01	401 −403	Added optional PWA 106326 Drift. (TB85453B1)	ALL
72−00−54 INSTALL−08	401 −403 407	Added optional PWA 106326 Drift. (TB85453B1) Revised Figure 401 for internal purposes. (Editorial)	ALL

CHAPTER 72

ENGINE GENERAL - TURBINE EXHAUST CASE

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE	72-00-54		
Removal-01		301	ALL
Task 72-00-54-020-001: Remove Turbine Exhaust Case		301	
Removal-02		301	4152 4156A 4158
Task 72-00-54-020-003: Remove External Plumbing Prior To Turbine Exhaust Case Removal		301	
Removal-02		301	4152-3 4156A-3 4158-3
Task 72-00-54-020-004: Remove External Plumbing Prior To Turbine Exhaust Case Removal		301	
Removal-03		301	ALL
Task 72-00-54-050-001: Remove The (PT4.95) Average Pressure And Temperature Probes		301	
Removal-04		301	ALL
Task 72-00-54-050-002-A: Remove The EGT (TT4.95) Thermocouple Cable - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		301	
Task 72-00-54-050-002-B: Remove The EGT (TT4.95) Thermocouple Cable - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		307	
Removal-05		301	ALL
Task 72-00-54-050-003-A: Remove The EGT (TT4.95) Box And Cable Assembly - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		301	
Task 72-00-54-050-003-B:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE (CONTINUED)	72-00-54		
Remove The EGT (TT4.95) Box And Cable Assembly - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		307	
Removal-06		301	ALL
Task 72-00-54-050-004-A:			
Remove Exhaust Gas Temperature Thermocouples, TT4.95 - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		301	
Task 72-00-54-050-004-B:			
Remove Exhaust Gas Temperature Thermocouples, TT4.95 - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		303	
Removal-07		301	ALL
Task 72-00-54-050-005:			
Remove EGT (TT4.95) Thermocouple Housing		301	
Removal-08		301	ALL
Task 72-00-54-020-002:			
Remove No. 4 Bearing And Seals		301	
Removal-09		301	ALL
Task 72-00-54-050-006-A:			
Remove EEC Thermocouple And Airframe Cable (W6) - For Engines Without The Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		301	
Task 72-00-54-050-006-B:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE (CONTINUED)	72-00-54		
Remove EEC Thermocouple And Airframe Cable (W6) - For Engines With Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		302	
Removal-10		301	ALL
Task 72-00-54-050-007: Remove EGT (TT4.95) Thermocouple Junction Box		301	
Removal-20		301	ALL
Task 72-00-54-020-005: Remove The Flange P Brackets And Hardware		301	
Installation-01		401	ALL
Task 72-00-54-420-001: Install Turbine Exhaust Case		401	
Installation-02		401	4152 4156A 4158
Task 72-00-54-420-003: Install External Plumbing After Turbine Exhaust Case Installation		401	
Installation-02		401	4152-3 4156A-3 4158-3
Task 72-00-54-420-004: Install External Plumbing After Turbine Exhaust Case Installation		401	
Installation-03		401	ALL
Task 72-00-54-450-001: Install The (PT4.95) Average Pressure And Temperature Probes		401	
Installation-04		401	ALL
Task 72-00-54-450-002-A: Install The EGT (TT4.95) Thermocouple Cable - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		401	
Task 72-00-54-450-002-B: Install The EGT (TT4.95) Thermocouple Cable - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		405	
Installation-05		401	ALL
Task 72-00-54-450-003-A:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE (CONTINUED)	72-00-54		
Install The EGT (TT4.95) Box And Cable Assembly - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		401	
Task 72-00-54-450-003-B: Install The EGT (TT4.95) Box And Cable Assembly - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		403	
Installation-06		401	ALL
Task 72-00-54-450-004-A: Install Exhaust Gas Temperature Thermocouples TT4.95 - For Engines Without The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		401	
Task 72-00-54-450-004-B: Install Exhaust Gas Temperature Thermocouples TT4.95 - For Engines With The Revised TT4.95 Cable And PT4.95 Sensing Manifold For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		403	
Installation-07		401	ALL
Task 72-00-54-450-005: Install EGT (TT4.95) Thermocouple Housing		401	
Installation-08		401	ALL
Task 72-00-54-420-002: Install No. 4 Bearing And Seals		401	
Installation-09		401	ALL
Task 72-00-54-450-006-A:			

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE (CONTINUED)	72-00-54		
Install EEC Thermocouple And Airframe Cable (W6) - For Engines Without The Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Pre SB PW4ENG 72-134)		401	
Task 72-00-54-450-006-B: Install EEC Thermocouple And Airframe Cable (W6) - For Engines With Revised EEC Thermocouple And Airframe Cable (W6) And Wiring Harness Support Tube For Increased Engine Core Clearance (Post SB PW4ENG 72-134)		406	
Installation-10		401	ALL
Task 72-00-54-450-007: Install EGT (TT4.95) Thermocouple Junction Box		401	
Installation-20		401	ALL
Task 72-00-54-420-005: Install The Flange P Brackets And Hardware		401	
Cleaning-01		601	ALL
Task 72-00-54-160-001: Clean EGT (TT4.95) Thermocouple		601	
Cleaning-02		601	ALL
Task 72-00-54-160-002: Clean EGT (TT4.95) Box And Cable		601	
Cleaning-03		601	ALL
Task 72-00-54-110-001: Clean Coke From The Turbine Exhaust Case, Pressure And Scavenge Tubes		601	
Inspection/Check-01		801	ALL
Task 72-00-54-990-001: Specific Fits And Clearances		801	
Inspection/Check-03		801	ALL
Task 72-00-54-210-001: Inspect EGT (TT4.95) Thermocouple Housing		801	
Inspection/Check-04		801	ALL
Task 72-00-54-210-002: Inspect Exhaust Gas Average Pressure (And Thermocouple Housing) PT4.95 Probe		801	
Inspection/Check-05		801	ALL

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
ENGINE GENERAL - TURBINE EXHAUST CASE (CONTINUED)	72-00-54		
Task 72-00-54-210-003: Visually Inspect EGT (TT4.95) Thermocouple		801	
Inspection/Check-06		801	ALL
Task 72-00-54-210-004: Inspect EGT (TT4.95) Box And Cable		801	
Inspection/Check-07		801	ALL

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

ENGINE EXTERNAL TUBES - DESCRIPTION/OPERATION-00

Task 72-09-71-990-001:

1. Engine External Tubes

A. General

(1) The PW4000 external tubes are divided into four systems. Each tube has a function number assigned that does not change with part progression as do the tube part numbers. The tube function number is not a part number. The tube function numbers will also appear in the Illustrated Parts Catalog and the Engine Manual sections. You can use the information in this section and the function numbers in the other publications to:

- Cross reference between the different publications
- Positively identify different tubes with a common nomenclature
- Reference the locations of all tubes and systems
- Use as a quick reference to identify a tube function and routing
- Find the installation procedure for each tube.

(2) This section is divided into four systems. (Air, Hydraulic, Fuel, and Lubrication). Each system is divided into subsystems. Each system has a tube schematic and a tube chart. The systems are divided into subsystems as follows:

System	Subsystem (Tube Function Identifier)
Air-	
	Air Actuation System (AA) Air Cooling System (AC) Air Pressurizing System (AP) Air Sense System (AS)
Hydraulic-	
	Hydraulic Control Pressure System (CP) Hydraulic Control Return System (CR)
Fuel-	
	Fuel Main Supply System (FM) Fuel Supply To Injector System (FS)
Lubrication-	
	Lubrication Breather System (LB) Lubrication Drain System (LD) Lubrication Pressure System (LP)

System	Subsystem (Tube Function Identifier)
(CONTINUED)	
	Lubrication Return Scavenge System (LR)
	Lubrication IDG System (LS)

B. Air − Air Actuation System (AA)

ENGINE EXTERNAL TUBES − REPAIR−00

Task 72−09−71−990−004:

1. Repair Part Number Index − Engine External Tubes
   A. Table 901 contains a listing of specific part numbers and the repairs which apply to each part number. Reference Service Bulletins are listed for parts introduced or obtained by Service Bulletins.

PART NUMBER	REPAIR	SERVICE BULLETIN
52T837−01 (Typical)	−01	None

Repair Part Number Index
Table 901

ENGINE EXTERNAL TUBES - REPAIR-01

Task 72-09-71-300-001:

1. Tube Assemblies - Voi-Shan Seal Repair Of Conical Seats

A. Equipment And Materials Required - None

B. Procedure

NOTE: This repair is to correct leakage of conical seats on tube fittings that have small nicks and scratches on the sealing surfaces.

(1) Loosen the tube nut and disconnect the tube.

(2) Make clean (wipe) the conical seat mating surfaces.

(3) Put the correct part number Voi-Shan seal on the male conical seat. See Table 901 and Table 902 or you can get the catalog from:

Voi-Shan Mfg.
Div. VSI Corp.
Box 512
8463 Higuera St.
Culver City, CA 90230

(4) With the Voi-Shan seal installed connect the tubes.

(5) Torque the tube nut to the correct torque for the tube size. See Table 901 and 902.

LOW PRESSURE COMPRESSOR (LPC) − HOW TO USE

Task 72−31−00−990−003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Low Pressure Compressor (LPC) parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED − This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED − This designation is applied to numbers used in other related engine model programs which are not at this time, applicable to the engine models represented by this manual.

LOW PRESSURE COMPRESSOR (LPC) - DESCRIPTION AND OPERATION

Task 72-31-00-990-002:

1. Low Pressure Compressor (LPC)

See Figure 1.

A. General

(1) The low pressure compressor (LPC) is a five stage rotor and stator assembly. The LPC consists of a five stage (stages 1, 1.6, 2, 3 and 4) rotor and four stages (stages 1, 1.6, 2 and 3) of stator assemblies. The 4th stage compressor stator is a part of the intermediate case.

B. LPC Rotor

(1) The LPC rotor consists of a titanium hub (stage 1) mechanically attached to a four stage (stages 1.6, 2, 3 and 4) titanium drum rotor. Titanium blades are installed in all five stages. The 1st stage of the rotor, commonly referred to as the fan stage, consists of 38 wide chord blade assemblies which are installed in slots 12 degrees from axial in the front compressor hub. The fan blades are retained at the rear by the drum rotor and at the front by a circumferential blade lock installed in aligned slots in the hub. Each fan blade has a single aft positioned part span shroud for added strength. Fan blades are replaceable in balanced pairs on installed engines. The blades in the remaining four stages of the rotor are installed in axial slots in the drum rotor and are retained by wire blade locks. Four pairs of knife-edge seals are integral to the drum rotor and are in axial alignment with each of the stages 1, 1.6, 2 and 3 stator inner shrouds.

(2) The rotor is driven by the low pressure turbine (LPT). The front compressor hub is splined to a titanium turbine shaft coupling which in turn is splined to the LPT shaft. Structural support for the rotor is provied by the No. 1 ball bearing which is mounted on the front compressor hub.

C. LPC Stator

(1) The LPC stator assembly consists of a single stage (stage 1 compressor stator assembly) full hoop aluminum case with titanium stator vanes mechanically attached to a three stage (stage 1.6, 2 and 3 compressor stator assembly) split case aluminum stator assembly with

titanium vanes installed in all three stages. The stage 1 stator consists of 88 solid vanes and is located immediately aft of the stage 1 LPC blades at the entrance to the primary gaspath. At the inner shroud of the stage 1 stator are a pair of PWA 407 abradable seal lands axially aligned with a pair of knife−edge seals on the drum rotor. The three stage (stages 1.6, 2 and 3) stator assembly also contains solid vanes and incorporates three PWA 407 abradable rubstrips at outer shroud locations in axial alignment with blades (stages 1.6, 2 and 3). At inner shroud locations are three pairs of PWA 407 abradable seal lands in axial alignment with pairs of knife−edge seals on the drum rotor. An aluminum LPC stage 4 duct which incorprates a PWA 407 abradable rubstrip in axial alignment with the stage 4 LPC blades is mechanically attached to the rear outer flange of the LPC compressor stator assembly.

(2) The LPC compressor stator assembly is supported structually by mechanical attachment to the fan exit inner case.

D. Inlet Cone

(1) The compressor inlet cone segment assembly is mounted on the front compressor hub and provides a smooth aerodynamic fairing at the inlet of the LPC. The compressor inlet cone segment assembly consists of an inlet cone front segment which is bolted to an inlet cone (rear) segment assembly which is bolted in turn to the front flange of the front compressor hub. Both inlet cone segments are fabricated from Kevlar fabric impregnated with epoxy resin.

E. Fan Exit Fairing

(1) Surrounding the front half of the stator assembly is a composite (Kevlar coated with polyurethane) fan exit fairing which acts as an aerodynamic splitter separating the primary (main gas generator) airstream from the secondary (fan discharge) airstream.

LOW PRESSURE COMPRESSOR (LPC) - DISASSEMBLY-01

Task 72-31-00-030-001:

1. Disassemble Low Pressure Compressor (LPC)

A. Prerequisites

(1) Disassemble No. 1 bearing and seal assembly. See Disassembly-02 (Task 72-31-00-030-002-001) or Disassembly-03 (Task 72-31-00-030-002-002).

B. Equipment And Materials Required

Special Tools:

PWA 85086	Arm, Lifting (2 Required)
PWA 85621	Eye, Lifting, Front (For Hub Only) (Optional to PWA 87221)
PWA 85660	Stand, Build/Storage (Optional to PWA 88183)
PWA 86534	Fixture, Lifting
PWA 87221	Eye, Lifting, Front (For Hub Only) (Optional to PWA 88748)
PWA 88183	Stand, Build/Storage
PWA 88748	Adapter, Lift And Turn (For Hub/HPC Rotor)

C. Procedure
See Figure 501.

Subtask 72-31-00-030-051:

(1) Remove the LPC Stage 4 duct as follows. See Figure 502.

(a) With the LPC in Fixture (PWA 85520), remove the nuts, washers, and bolts that attach the LPC Stage 4 duct to the LPC (Stage 1.6, 2 and 3) compressor stator assembly (called compressor stator assembly).

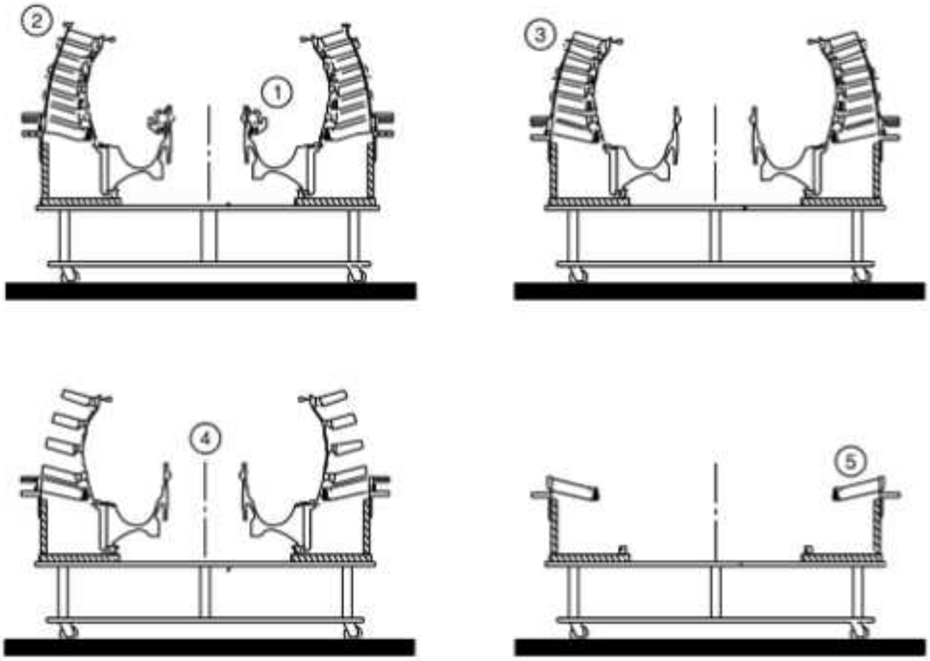
(b) Remove the Stage 4 duct and put it on a rack.

Subtask 72-31-00-030-052:

(2) Remove the compressor stator assembly as follows. See Figures 502 and 503.

(a) Remove the 50 nuts, 100 washers, and 50 bolts that attach the Stage 1 compressor stator assembly (called Stage 1 stator) to the compressor stator assembly.

(b) Remove the 48 nuts, 96 washers, 48 bolts, and brackets that attach both halves of the compressor stator assembly at approximately 3 and 9 o'clock locations. Remove the brackets and stator halves.



1. REMOVE NO. 1 BEARING AND CARBON SEAL ASSEMBLY.
2. REMOVE LPC STAGE 4 DUCT.
3. REMOVE LPC (STAGE 1.6, 2 AND 3) COMPRESSOR STATOR ASSEMBLY HALVES.
4. REMOVE AXIAL COMPRESSOR ROTOR ASSEMBLY.
5. REMOVE LPC STAGE 1 COMPRESSOR STATOR ASSEMBLY.

(c) Remove the two nuts and bolts that attach the data plate to the bracket on the upper stator half. Remove the data plate.

Subtask 72−31−00−030−053:

(3) Remove the Stage 1 stator as follows.

(a) Clamp PWA 86534 Fixture to the rear of the axial compressor rotor assembly (called rotor).

(b) Remove the 19 bolts that attach the the rotor to Fixture (PWA 85520).

(c) Attach PWA 85086 Arm to PWA 86534 Fixture with the detail nut and safety pin. With a hoist attached to the arm, raise the rotor from the stand and remove the Stage 1 stator.

(4) Trunnion the rotor as follows. See Figure 504.

(a) Thread either PWA 87221 or PWA 85621 Eye or PWA 88748 Adapter into the ID of the hub.

(b) Attach PWA 85086 Arm to the eye.

(c) With a hoist through the eye, trunnion the rotor to rear end down. Remove the arm and fixture from the rear and lower the rotor onto PWA 88183 or PWA 85660 Stand.

(5) Remove the arm and eye from the hub.

LOW PRESSURE COMPRESSOR (LPC) - DISASSEMBLY-02

Task 72-31-00-030-002-001:

1. Disassemble No. 1 Bearing And Seal Assembly (Mechanical Method)

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 29389 Hydraulic Pump
PWA 29614 Wrench, Mechanical
PWA 29615 Holder
PWA 45419 Multiplier, Pneumatic (Optional to PWA 80651)
PWA 76154 Adapter, Lift And Trunnion (2 Required)
PWA 80651 Multiplier, Pneumatic
PWA 85200 Puller
PWA 85201 Puller
PWA 85520 Fixture, Install And Remove
PWA 85590 Protector, Plastic
PWA 85653 Wrench, Torque
PWA 85791 Adapter, Counter-Torque
PWA 85793 Adapter, Handling

B. Procedure

Subtask 72-31-00-030-054:

(1) Install PWA 85520 Fixture onto axial compressor rotor assembly located in Stand (PWA 88183 or PWA 85660).

(2) Install PWA 85791 Adapter into hub ID and secure with detail nut.

(3) Attach hoist to PWA 28657 Sling with two PWA 76154 Adapters to spools on fixture. Use spools marked for fixture LPC. Trunnion axial compressor rotor assembly to rear end up and place on work area.

(4) Remove sling and adapters from fixture.

(5) Cut flare and drift out rivets securing No. 1 bearing retaining nut to hub assembly.

(6) Position PWA 85793 Adapter onto Adapter (PWA 85791). Position PWA 85653 Wrench over Adapter (PWA 85793) onto No. 1 bearing nut. Position PWA 29614 Wrench over splines of Wrench (PWA 85653). Position PWA 29615 Holder over splines of Adapter (PWA 85793) and onto pins of Wrench (PWA 29614). Install either PWA 45419 or PWA 80651 Multiplier on the mechanical wrench. Using Wrench (PWA 29614) loosen nut. Remove tooling and nut from hub.

(7) Install PWA 85200 Puller to inner race puller groove. Attach PWA 29389 Pump and remove upper half of inner race. Remove tooling and inner race half.

LOW PRESSURE COMPRESSOR (LPC) − DISASSEMBLY−02

(8) Remove three screws securing No. 1 bearing seal assembly to No. 1 bearing outer race flange. Carefully lower seal assembly to rest on hub flange. Remove No. 1 bearing outer race and balls from hub.

(9) Install PWA 85201 Puller to inner race front half (front side). Attach PWA 29389 Pump and remove front half of inner race. Remove tooling and front inner race.

(10) Remove seal seat from hub. Remove No. 1 bearing seal assembly from hub. Install PWA 85590 Protector over hub.

(11) Protect carbon seal, seal seat and bearing using protective wrapper.

Previous Pageblock   Return to Previous Menu   Next Pageblock

Task 72-31-00-030-002-002:

1. Disassemble No. 1 Bearing And Seal Assembly (Hydraulic Method)

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 28668 Pump
PWA 28669 Cart
PWA 29389 Hydraulic Pump
PWA 29510 Pump (Optional to PWA 28668)
PWA 25000 Wrench, Hydraulic
PWA 76154 Adapter, Lift And Trunnion (2 Required)
PWA 85200 Puller
PWA 85201 Puller
PWA 85520 Fixture, Install And Remove
PWA 85590 Protector, Plastic
PWA 85641 Wrench, Torque
PWA 85791 Adapter, Counter-Torque
PWA 85792 Adapter, Holding

B. Procedure

Subtask 72-31-00-030-055:

(1) Install PWA 85520 Fixture onto axial compressor rotor assembly located in Stand (PWA 88183 or PWA 85660).

(2) Install PWA 85791 Adapter into hub ID and secure with detail nut.

(3) Attach hoist to PWA 28657 Sling with two PWA 76154 Adapters to spools on fixture. Use spools marked for fixture LPC. Trunnion axial compressor rotor assembly to rear end up and place on work area.

(4) Remove sling and adapters from fixture.

(5) Cut flare and drift out rivets securing No. 1 bearing retaining nut to hub assembly.

(6) Install PWA 85792 Adapter onto adapter. Install PWA 85641 Wrench on nut. Remove PWA 25000 Wrench from PWA 28669 Cart and install on wrench and adapter. Using PWA 28668 or PWA 29510 Pump actuate wrench to loosen nut on hub. Remove tooling and nut from hub.

(7) Install PWA 85200 Puller to inner race puller groove. Attach PWA 29389 Pump and remove upper half of inner race. Remove tooling and inner race half.

(8) Remove three screws securing No. 1 bearing seal assembly to No. 1 bearing outer race flange. Carefully lower seal assembly to rest on hub flange. Remove No. 1 bearing outer race and balls from hub.

(9) Install PWA 85201 Puller to inner race front half (front side). Attach PWA 29389 Pump and remove front half of inner race. Remove tooling and front inner race.

(10) Remove seal seat from hub. Remove No. 1 bearing seal assembly from hub. Install PWA 85590 Protector over hub.
(11) Protect carbon seal, seal seat and bearing using protective wrapper.

LOW PRESSURE COMPRESSOR (LPC) - INSPECTION/CHECK-01

Task 72-31-00-990-004:

1. General Inspection Requirements - Low Pressure Compressor (LPC)

   A. Organization Of Individual Part Or Subassembly Inspection Data

      (1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

      (2) Inspection/Check-00 section contains, where applicable:

         (a) Part number(s) for which the inspection data is applicable.

         (b) Service Bulletin numbers applicable to part number(s).

         (c) Inspection/Check numbers, data categories and applicability data.

      (3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

         (a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

         (b) Identification of mechanical disassembly required prior to inspection.

         (c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

         (d) Identification of part/subassembly cleaning required prior to inspection.

      (4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

         (a) Fluorescent Penetrant Method

         (b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−31−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−31−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

LOW PRESSURE COMPRESSOR (LPC) − INSPECTION/CHECK−01

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

    (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

    (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

LOW PRESSURE COMPRESSOR (LPC) - INSPECTION/CHECK-03

Task 72-31-00-990-005:

1. Visual Inspection - Low Pressure Compressor (LPC)
   A. For inspection requirements applicable to installed (accessible) parts of Low Pressure Compressor (LPC) see 72-00-31, Inspection/Check-03 (Task 72-00-31-990-002).

Previous Pageblock Return to Previous Menu Next Pageblock

LOW PRESSURE COMPRESSOR (LPC) − INSPECTION/CHECK−04

Task 72−31−00−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, C or D located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.
D	Clearance or fit relates to a component for which you think you would want to replace the used part with a new or restored part (in which the wear or seal surface has been restored to manufactured dimensions at the time of overhaul in order to restore a wear or sealing surface). It is necessary to dimensionally examine this fit unless all of the conditions that follow are met. The used wear or sealing component has been replaced with a new or a used part restored to the manufactures specified dimensions. The mating part(s) have been visually and dimensionally examined as necessary by the applicable PW4000 Series CIR, PN 51A357 sections(s) for the part(s) and meet the permitted wear and dimensional requirements on the surface(s) related to the clearance or fit.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions		Limits	
			Min	Max	Min	Max
440	A	Gap, No. 1 Bearing Seal Ring (72-31-17) (See Figure 803, Sheet 2)

LOW PRESSURE COMPRESSOR (LPC) - INSPECTION/CHECK-05

Task 72-31-00-200-005:

1. Functional Check - Vacuum Check No. 1 Bearing Compartment

A. Equipment Materials Required

Special Tools:
CTE 6075 Cart, Vacuum
PWA 85478 Adapter, Vacuum Check
PWA 85584 Protector

B. Procedure

See Figure 801.

(1) Ensure that packing is installed in OD groove of seal assembly and in OD groove of adapter.

(2) Attach hoist to eye bolt on PWA 85478 Adapter and lift to position it over hub and No. 1 bearing.

(3) Attach vacuum hose and pressure sense line from CTE 6075 Vacuum Cart and vacuum check No. 1 bearing compartment with the vacuum cart pressure set at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute).

(a) (Pre SB PW4ENG 72-245) Airflow must not exceed 14 lbs. (6.36 kg) per hour.

(b) (Post SB PW4ENG 72-245) Airflow must not exceed 5 lbs. (2.27 kg) per hour.

(4) Disconnect lines from adapter. Attach hoist to eye bolt on adapter and remove from No. 1 bearing.

(5) Install PWA 85584 Protector over No. 1 bearing assembly.

LOW PRESSURE COMPRESSOR (LPC) - ASSEMBLY-01

Task 72-31-00-400-001:

1. Assemble Low Pressure Compressor (LPC)
   A. Prerequisites
      (1) Assemble axial compressor rotor assembly. See 72-31-01, Assembly-01 (Task 72-31-01-440-001).
      (2) Assemble No. 1 bearing (carbon) seal assembly. See 72-31-17, Assembly-01 (Task 72-31-17-440-001).
      (3) See Inspection/Check-04, (Task 72-31-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.
   B. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 76154 Adapter, Lift And Trunnion (2 Required)
PWA 85520 Fixture, Install And Remove
PWA 85589 Eye, Lifting
PWA 85660 Stand, Build/Storage
PWA 85791 Adapter, Counter-Torque

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P09-014	Sealant, Silicone Rubber (PWA 36003)

   C. Procedure
      See Figure 1001.

Subtask 72-31-00-430-051:
      (1) Attach PWA 28657 Sling with hoist and two PWA 76154 Adapters to PWA 85520 Fixture and place feet end down on work area.
      (2) Install LPC Stage 1 compressor stator assembly to Fixture (PWA 85520), bolt hole flange up.
      (3) With axial compressor rotor assembly in PWA 85660 Stand, hub end up, install PWA 85791 Adapter into hub ID and secure with detail nut.

NOTE: This adapter is not used until Assembly-02 (Task 72-31-00-400-002-001) and Assembly-03 (Task 72-31-00-400-002-002).

Low Pressure Compressor (LPC) Assembly
Figure 1001 (Sheet 2)
(Task 72−31−00−400−001)

(4) With Sling (PWA 28657), hoist and two Adapters (PWA 76154), lift and trunnion Fixture (PWA 85520) to feet end up. Install fixture onto axial compressor rotor assembly and secure fixture to rotor.

(5) Lift and trunnion fixture with rotor assembly and place feet end down on work area. Remove hoist and fixture from rotor.

Subtask 72−31−00−430−052:

(6) Clean mating area of stator halves and seal assemblies by SPOP 208 Wipe Method (Task 70−21−00−110−040). Surfaces shall be thoroughly dried in air for 15 minutes.

(7) Apply Silicone Rubber (P09−014) on Surfaces AG and AH for Distance AD. Silicone rubber must not protrude into air flowpath after installing seal assembly. See Figure 1002.

(8) Apply a thin bead of Silicone Rubber (P09−014) on seal assembly Surface AF (typically three places) for Distance AE. See Figure 1002.

(9) Install seal assembly until Surface AF contacts stator case OD. Assemble before silicone rubber cures. See Figure 1002.

Subtask 72−31−00−430−063:

(10) (References 1620, 1621, 1622, and 1623) Do a check of the blade tip clearances. Do this check before you assemble the axial compressor rotor assembly to the LPC (Stage 1.6, 2 and 3) compressor stator assembly. See Figure 1001.

NOTE: It is not necessary to do a check of blade tip clearances if all of the items that follow apply: 1) The blades are installed in the rotor and are the same blades that were installed at the previous installation 2) The blades have been inspected and show no signs of FOD, cracks, or erosion 3) The outer airseals are either serviceable or have been repaired.

(a) Measure the OD of the axial compressor rotor assembly at the Stage 1.6, 2, 3, and 4 blades.

(b) Measure the ID of the LPC (Stage 1.6, 2 and 3) compressor stator assembly at each of the outer airseals.

(c) Measure the ID of the Stage 4 duct at the outer airseal.

(d) Use the above measurements to calculate the tip clearances for the four stages of blade.

1. Seal Assembly, PN 50B210 (2 Required)
2. 0.000 - 0.010 Inch (0.000 - 0.254 mm)

Sealant Application
Figure 1002
(Task 72-31-01-400-002)

(e) The tip clearances must be in the limits specified in Inspection/Check-04 (Task 72-31-00-990-001).

Subtask 72-31-00-430-064:

(11) Attach PWA 85589 Lifting Eye to LPC (Stage 1.6, 2 and 3) compressor stator assembly halves and install to axial compressor rotor assembly larger OD down mating with LPC Stage 1 compressor stator assembly. Install 48 bolts, threads lubricated with Engine Oil (P03-001), 96 washers, 16 brackets and 48 nuts to secure stator halves. Tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(12) Remove excess sealant. Cure in ambient air of 25 percent minimum relative humidity for 24 hours prior to engine run.

(13) Align holes in Stage 1 stator flange with holes in compressor stator flange and install 50 bolts, threads lubricated with Engine Oil (P03-001), 100 washers and 50 nuts. With bolt heads down, tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Subtask 72-31-00-430-053:

CAUTION: THE FOLLOWING 4TH STAGE DUCTS AND STAGE 4 LPC BLADES MUST BE ASSEMBLED IN SETS ONLY OR BLADE, RUBSTRIP AND SHROUD DAMAGE MAY OCCUR.

- PN 50B227 4TH STAGE DUCT MUST BE ASSEMBLED WITH PN 51B404 STAGE 4 LPC BLADE.

- PN 50B023 4TH STAGE DUCT CAN BE ASSEMBLED WITH PN 51B104 OR PN 51B404 STAGE 4 LPC BLADES.

THE ABOVE SETS ARE INTERCHANGEABLE WITH PN 54B016 OR PN 56B916 OR PN 56B016 OR PN 56B116 LPC COMPRESSOR STATOR ASSEMBLIES.

(14) Install 4th stage duct to previously installed stators. Align bolt holes and install 50 bolts, threads lubricated with Engine Oil (P03-001), 100 washers and 50 nuts. With bolts heads up, tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(15) Install data plate to bracket on stator half. Secure with two screws, threads lubricated with Engine Oil (P03-001), and nuts. Tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

D. Postrequisites

(1) Install the No. 1 bearing and seal assembly. See Assembly-02 (Task 72-31-00-400-002) or Assembly-03 (Task 72-31-00-400-003).

LOW PRESSURE COMPRESSOR (LPC) - ASSEMBLY-02

Task 72-31-00-400-002-001:

1. Install The No. 1 Bearing And Seal Assembly (Mechanical Method)

A. Prerequisites

(1) Assemble the low pressure compressor (LPC). See 72-31-00, Assembly-01 Task 72-31-00-400-001.

B. Equipment And Materials Required

Special Tools:

PWA 26523	Riveter (Optional to PWA 86338)
PWA 29614	Wrench, Mechanical
PWA 29615	Holder
PWA 45419	Multiplier, Pneumatic (Optional to PWA 80651)
PWA 80651	Multiplier, Pneumatic
PWA 85178	Gage, Assembly
PWA 85186	Drift
PWA 85524	Ring, Alignment
PWA 85584	Protector, Plastic
PWA 85653	Wrench, Torque
PWA 85654	Adapter, Handling
PWA 85793	Adapter, Handling
PWA 86338	Riveter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Pen, Marker (PMC 4092)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	2	72-31-00/7/200

C. Procedure

NOTE: The LPC is rear end up in PWA 85520 Fixture. PWA 85791 Adapter is installed in the ID of the front compressor hub assembly (called hub).

Subtask 72−31−00−430−054:

(1) (Reference 460) Measure Dimension F as follows (Method 1). See Figure 1001.

NOTE: To measure Dimension F, use either this method or Method 2.

(a) Install the No. 1 bearing seal seat (called seal seat), the bearing inner races, and the No. 1 bearing (inner race) retaining nut (called nut), lubricated with Engine Oil P03−001, on PWA 85178 Gage. The diametral empty space between the gage and the stacked parts must be 0.001 − 0.005 inch (0.026 − 0.127 mm).

(b) Install PWA 85654 Adapter on the gage. Install PWA 85653 Wrench in the nut. Install PWA 29614 Wrench on PWA 85653 Wrench. Install PWA 29615 Holder. Tighten and torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). There must be zero clearance between all mating parts.

R (c) Put the detail−8 bar and dial indicator of the gage on top of the nut. Move the dial indicator off the detail−16 flush pin to set the indicator on zero.

(d) Move the dial indicator on the flush pin. Read the measurement (Dimension M). Write the measurement. Do this measurement at several positions. Calculate the average value of Dimension M. Add this value to the basic gage size
R stamped on the detail−8 bar (Dimension X). Call this sum Dimension F.

$$F = X + \text{average } M$$

(e) Remove the engine parts from the gage.

(2) (Reference 460) Measure Dimension F as follows (Method 2).

NOTE: To measure Dimension F, use either this method or Method 1.

(a) Measure the thickness of each of the parts that follow. Do the measurements at four positions that are at the same distance from each other. Write the measurements.

1 The seal seat (Dimension K)

2 The inner races (Dimensions N and P)

3 The nut (Dimension Q).

(b) Add together the maximum thicknesses from each part. Call this sum Dimension F.

F = maximum K + maximum N + maximum P + maximum Q

(3) (Reference 460) Measure Dimension B as follows. See Figure 1002.

(a) Measure the dimension from the rear (top) face of the fan hub to the shoulder of the hub. Use the detail−8 bar, detail−21 flush pin, and detail dial indicator of PWA 85178 Gage. Call this Dimension Y.

NOTE: It is permitted to use standard shop equipment to measure Dimension B.

(b) Add Dimension Y to the basic gage size stamped on the detail−8 bar (Dimension X) if the flush pin is below the top of the bar. Subtract Dimension Y from Dimension X if the flush pin is above the top of the bar. Call this Dimension B.

B = X + Y   OR   B = X − Y

NOTE: This equation does not apply if you do not use the gage.

Subtask 72−31−00−430−055:

(4) Install the No. 1 bearing (carbon) seal assembly on the hub as follows. See Figure 1003.

Subtask 72−31−00−430−056:

(5) Install the seal seat on the hub. The flat face marked FRONT must be face down.

Subtask 72−31−00−430−057:

(6) Install the No. 1 ball bearing on the hub as follows.

(a) Heat the inner races. Refer to Standard Practices Manual, PN 585005.

(b) With correct gloves on your hands, remove the front half of the inner race (without the puller groove). Install the inner race on the hub. Use PWA 85186 Drift.

(c) Install the outer race on the hub.

(d) Lift the outer race to put it a little above the inner race. Install the bearing balls and cage in the outer race. Lower the outer race.

(e) With correct gloves on your hands, remove the rear half of the inner race from the heat source. Hold the inner race with the puller groove up. Align the X marks on the front and rear inner races. Install the inner race on the hub. Use PWA 85186 Drift.

Subtask 72−31−00−430−058:

CAUTION: IF THE NUT YOU INSTALL IS NOT NEW, YOU MUST PUT NEW SILVER PLATE ON IT BEFORE YOU INSTALL IT. IF YOU DO NOT, IT WILL CAUSE DAMAGE TO THE MATING PARTS. TO PLATE THE NUT, REFER TO PW4000 Series CIR, PN 51A357.

(7) Install the nut on the hub as follows. See Figure 1004.

(a) Install the nut, threads lubricated with Engine Oil P03−001, on the hub.

(b) Install PWA 85793 Adapter on PWA 85791 Adapter.

(c) Install PWA 85653 Wrench on the adapter.

(d) Install PWA 29614 Wrench on the adapter. Install PWA 29615 Holder and PWA 45419 Multiplier or PWA 80651 Multiplier on the wrench.

(e) Tighten the nut with PWA 29614 Wrench.

CAUTION: IF YOU MUST COMPLETE THE FOLLOWING TORQUE PROCESS MORE THAN THREE TIMES, YOU MUST REMOVE THE NUT AND PLATE IT AGAIN BEFORE YOU TORQUE IT THE FOURTH TIME. THE MAXIMUM NUMBER OF TIMES YOU CAN COMPLETE THE TORQUE PROCESS BEFORE IT IS NECESSARY TO RE−PLATE THE NUT IS THREE. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(8) (Reference 460) Torque the nut as follows.

(a) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.

(b) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).

(c) Use a Marker Pen P05−045 and make a reference point mark on the nut and an adjacent part. Marks must be aligned.

(d) Measure Dimension L as follows.

1 The temperature of all parts must be within ± 5°F (2.8°C) of room temperature when you measure the parts.

2 Set the dial indicator of PWA 85178 Gage to zero.

3 Measure the dimension from the rear (top) face of the nut to the rear (top) face of the hub (Dimension Z). Use the detail−15 bar and the detail−16 flush pin. Do the measurement several times. Calculate the value of average Dimension Z.

NOTE: It is permitted to use standard shop equipment to measure Dimension L.

4 Add Dimension Z to the basic gage size stamped on the detail bar if the flush pin is below the top of the detail bar. Subtract Dimension Z from the basic gage size stamped on the detail

bar if the flush pin is above the top of the detail bar.

L = detail−15 basic gage size + average Z OR
L = detail−15 basic gage size − average Z

NOTE: This equation does not apply if you do not use the gage.

5 The statements that follow must be true:

L <= F − B + 0.000 inch (0.0000 mm) AND
L >= F − B − 0.001 inch (0.025 mm)

(e) Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.

(f) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).

(g) Do a check of the reference points as follows.

1 The reference point on the nut must be either aligned with the reference point on the mating part or beyond it within 1 degree 30 minutes.

2 If the reference points are within limits, turn the nut through an angle of 14 − 16 degrees. If necessary, advance 2 degrees 30 minutes, maximum, to the next locking feature.

3 If the reference points are not within limits, do steps (d), (e), and (f), in that order, until the reference points are within limits. Then do step (g).

(9) Remove from the hub the tools that you used to torque the nut.

Subtask 72−31−00−430−059:

(10) Install the rivets in the nut as follows.

(a) Install two rivets, 180 degrees apart, through the hub and the nut. The head of the rivet must be in the ID of the hub.

(b) Flare the heads of the rivets. Use PWA 86338 Riveter or PWA 26523 Riveter.

(11) Put PWA 85524 Ring over the flange of the bearing. With the detail foolproof and location pins, align the bearing with the seal assembly.

Subtask 72−31−00−430−062:

(12) Attach the bearing to the seal assembly as follows.

  (a) Apply Engine Oil P03−001 to the threads of three fillister head screws.

  (b) Lift the seal assembly to touch the flange of the bearing outer race.

  (c) Install the three screws in the outer race. Tighten and torque the screws to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking threads. The maximum torque permitted is 95 lb−in. (10.734 N.m).

(13) Remove the ring from the hub. Install PWA 85584 Protector over the bearing and seal assembly.

LOW PRESSURE COMPRESSOR (LPC) - ASSEMBLY-03

Task 72-31-00-400-002-002:

1. Install The No. 1 Bearing And Seal Assembly (Hydraulic Method)

A. Prerequisites

(1) Assemble the low pressure compressor. See Assembly-01 Task 72-31-01-440-001.

B. Equipment And Materials Required

Special Tools:

PWA 25000	Wrench, Hydraulic
PWA 26523	Riveter (Optional to PWA 86338)
PWA 28668	Pump
PWA 28669	Cart
PWA 29510	Pump (Optional to PWA 28668)
PWA 85178	Gage, Assembly
PWA 85186	Drift
PWA 85524	Ring, Alignment
PWA 85584	Protector, Plastic
PWA 85641	Wrench, Torque
PWA 85792	Adapter, Holding
PWA 86338	Riveter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Pen, Marker (PMC 4092)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	2	72-31-00/7/200

C. Procedure

NOTE: The LPC is rear end up in PWA 85520 Fixture. PWA 85791 Adapter is installed in the ID of the front compressor hub assembly (called hub).

Subtask 72−31−00−430−065:

(1) (Reference 460) Measure Dimension F as follows (Method 1). See Figure 1001.

NOTE: To measure Dimension F, use either this method or Method 2.

(a) Install the No. 1 bearing seal seat (called seal seat), the bearing inner races, and the No. 1 bearing (inner race) retaining nut (called nut), lubricated with Engine Oil P03−001, on PWA 85178 Gage. The diametral empty space between the gage and the stacked parts must be 0.001 − 0.005 inch (0.026 − 0.127 mm).

(b) Attach PWA 85792 Adapter to the gage. Install PWA 85641 Wrench on the nut. Remove PWA 25000 Wrench from PWA 28669 Cart and install it on PWA 85641 Wrench. With PWA 28668 Pump or PWA 29510 Pump, tighten and torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). There must be zero clearance between all mating parts.

R (c) Put the detail−8 bar and dial indicator of the gage on top of the nut. Move the dial indicator off the detail−16 flush pin to set the indicator on zero.

(d) Move the dial indicator on the flush pin. Read the measurement (Dimension M). Write the measurement. Do this measurement at several positions. Calculate the average value of Dimension M. Add this value to the basic gage size
R stamped on the detail−8 bar (Dimension X). Call this sum Dimension F.

$$F = X + \text{average } M$$

(e) Remove the engine parts from the gage.

(2) (Reference 460) Measure Dimension F as follows (Method 2).

NOTE: To measure Dimension F, use either this method or Method 1.

(a) Measure the thickness of each of the parts that follow. Do the measurements at four positions that are at the same distance from each other. Write the measurements.

1 The seal seat (Dimension K)

2 The inner races (Dimensions N and P)

3 The nut (Dimension Q).

(b) Add together the maximum thicknesses from each part. Call this sum Dimension F.

F = maximum K + maximum N + maximum P + maximum Q

(3) (Reference 460) Measure Dimension B as follows. See Figure 1002.

(a) Measure the dimension from the rear (top) face of the fan hub to the shoulder of the hub. Use the detail−8 bar, detail−21 flush pin, and detail dial indicator of PWA 85178 Gage. Call this Dimension Y.

NOTE: It is permitted to use standard shop equipment to measure Dimension B.

(b) Add Dimension Y to the basic gage size stamped on the detail−8 bar (Dimension X) if the flush pin is below the top of the bar. Subtract Dimension Y from Dimension X if the flush pin is above the top of the bar. Call this Dimension B

B = X + Y OR B = X − Y

NOTE: This equation does not apply if you do not use the gage.

Subtask 72−31−00−430−066:

(4) Install the No. 1 bearing (carbon) seal assembly on the hub as follows. See Figure 1003.

Subtask 72−31−00−430−067:

(5) Install the seal seat on the hub. The flat face marked FRONT must be face down.

Subtask 72−31−00−430−068:

(6) Install the No. 1 ball bearing on the hub as follows.

(a) Heat the inner races. Refer to Standard Practices Manual, PN 585005.

(b) With correct gloves on your hands, remove the front half of the inner race (without the puller groove). Install the inner race on the hub. Use PWA 85186 Drift.

(c) Install the outer race on the hub.

(d) Lift the outer race to put it a little above the inner race. Install the bearing balls and cage in the outer race. Lower the outer race.

(e) With correct gloves on your hands, remove the rear half of the inner race from the heat source. Hold the inner race with the puller groove up. Align the X marks on the front and rear inner races. Install the inner race on the hub. Use PWA 85186 Drift.

Subtask 72−31−00−430−060:

CAUTION: IF THE NUT YOU INSTALL IS NOT NEW, YOU MUST PUT NEW SILVER PLATE ON IT BEFORE YOU INSTALL IT. IF YOU DO NOT, IT WILL CAUSE DAMAGE TO THE MATING PARTS. TO PLATE THE NUT, REFER TO PW4000 Series CIR, PN 51A357.

(7) Install the nut on the hub as follows. See Figure 1004.

(a) Install the nut, threads lubricated with Engine Oil P03−001, on the hub.

(b) Install PWA 85792 Adapter on PWA 85791 Adapter.

(c) Install PWA 85641 Wrench on the nut.

(d) Remove PWA 25000 Wrench from PWA 28669 Cart. Install the wrench on PWA 85792 Adapter.

(e) Use either PWA 28668 Pump or PWA 29510 Pump to torque the nut.

CAUTION: IF YOU MUST COMPLETE THE FOLLOWING TORQUE PROCESS MORE THAN THREE TIMES, YOU MUST REMOVE THE NUT AND PLATE IT AGAIN BEFORE YOU TORQUE IT THE FOURTH TIME. THE MAXIMUM NUMBER OF TIMES YOU CAN COMPLETE THE TORQUE PROCESS BEFORE IT IS NECESSARY TO RE−PLATE THE NUT IS THREE. TO PLATE THE NUT, REFER TO PW4000 Series CIR, PN 51A357.

(8) (Reference 460) Torque the nut as follows.

(a) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m). Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.

(b) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).

(c) Use a Marker Pen P05−045 and make a reference point mark on the nut and an adjacent part. Marks must be aligned.

(d) Measure Dimension L as follows.

1 The temperature of all parts must be within ± 5°F (2.8°C) of room temperature when you measure the parts.

2 Set the dial indicator of PWA 85178 Gage to zero.

3 Measure the dimension from the rear (top) face of the nut to the rear (top) face of the hub (Dimension Z). Use the detail−15 bar and the detail−16 flush pin. Do the measurement several times. Calculate the value of average Dimension Z.

NOTE: It is permitted to use standard shop equipment to measure Dimension L.

4 Add Dimension Z to the basic gage size stamped on the detail bar if the flush pin is below the top of the detail bar. Subtract Dimension Z

from the basic gage size if the flush pin is above the top of the detail bar.

L = detail−15 basic gage size + average Z OR
L = detail−15 basic gage size − average Z

NOTE: This equation does not apply if you do not use the gage.

5 The statements that follow must be true:

L <= F − B + 0.000 inch (0.0000 mm) And
L >= F − B − 0.001 inch (0.025 mm)

(e) Turn the nut through an angle of 14 − 16 degrees. Loosen the nut to zero.

(f) Torque the nut to 33,600 − 37,200 lb−in. (3796.289 − 4203.035 N.m).

(g) Do a check of the reference points as follows.

1 The reference point on the nut must be either aligned with the reference point on the mating part or beyond it within 1 degree 30 minutes.

2 If the reference points are within limits, turn the nut through an angle of 14 − 16 degrees. If necessary, advance 2 degrees 30 minutes, maximum, to the next locking feature.

3 If the reference points are not within limits, do steps (d), (e), and (f), in that order, until the reference points are within limits. Then do step (g).

(9) Remove from the hub the tools that you used to torque the nut.

Subtask 72−31−00−430−061:

(10) Install the rivets in the nut as follows.

(a) Install two rivets, 180 degrees apart, through the hub and the nut. The head of the rivet must be in the ID of the hub.

(b) Flare the heads of the rivets. Use PWA 86338 Riveter or PWA 26523 Riveter.

(11) Put PWA 85524 Ring over the flange of the bearing. With the detail foolproof and location pins, align the bearing with the seal assembly.

Subtask 72−31−00−430−070:

(12) Attach the bearing to the seal assembly as follows.

  (a) Apply Engine Oil P03−001 to the threads of three fillister head screws.

  (b) Lift the seal assembly to touch the flange of the bearing outer race.

  (c) Install the three screws in the outer race. Tighten and torque the screws to 22 lb−in. (2.486 N.m) plus the torque necessary to turn the screw through the self−locking threads. The maximum torque permitted is 95 lb−in. (10.734 N.m).

(13) Remove the ring from the hub. Install PWA 85584 Protector over the bearing and seal assembly.

LOW PRESSURE COMPRESSOR (LPC) - STORAGE-01

Task 72-31-00-530-001:

1. Pack Low Pressure Compressor (LPC)

A. Equipment And Materials Required

Special Tools:
PWA 28657 Sling
PWA 76154 Adapter (Two Necessary)
PWA 85520 Fixture

Consumable Materials:

NOTE: The following items not normally supplied by container manufacturer.

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-156	Seal, Lead
P15-001	Dehydrator

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Lockwire, MS20995-C41				

Packaging Equipment:

NOTE: The following table lists assembly number, dimensions, and gross weight for low pressure compressor shipping container available from Pratt & Whitney. Further information can be obtained from:

Commercial Parts Support
Commercial Engine Business
Pratt & Whitney
400 Main St.
East Hartford, CT 06108

Container Assembly No.	Dimensions	Approximate Gross Weight Including Low Pressure Compressor
P60040	72.5 Inch (1841.500 mm) x 72.5 Inch (1841.500 mm) x 56.5 Inch (1435.100 mm)	2,075 lbs. (941.20 kg)

LOW PRESSURE COMPRESSOR (LPC) − STORAGE−01

B. Procedure

NOTE: The LPC is installed in either PWA 88183 or PWA 85660 Stand.

(1) Install PWA 85520 Fixture onto low pressure compressor. See Figure 1201.
  (a) Using PWA 76154 Adapters, PWA 28657 Sling, and a hoist, raise PWA 85520 Fixture.
  (b) Position fixture to LPC and secure to LPC hub using 19 bolts (1201/1) and to shroud using six clamps (1201/2).
(2) Remove top half of P60040 Container Assembly and upper support detail.
  (a) Actuate relief valve on side of container to release pressure before opening container.
  (b) Loosen nuts securing container flange bolts, and rotate bolts 1/4 turn.
  (c) Connect suitable sling to lifting rings on cover of container. Using hoist, remove top cover of container.
  (d) Remove nut (1202/2) from tierod. Using suitable sling, lift upper support (1202/1) from lower support (1202/5). See Figure 1202.
(3) Using hoist position LPC, rear end down, over P60040 Container Assembly. See Figure 1202.
(4) Lower LPC onto lower support (1202/5), aligning dowel pins in support with boltholes in case.
(5) Secure case to lower support with 24 flat washers (1202/6), lockwashers (1202/8) and cap screws (1202/7).
(6) Remove PWA 85520 Fixture from LPC.

(7) Using hoist and suitable sling, carefully install upper support (1202/1) onto LPC.
(8) Secure upper support to lower support with flat washer (1202/4), lockwasher (1202/3) and hex−head nut (1202/2), threads lubricated with Engine Oil (P03−001). Torque hex−head nut to 735 − 815 lb−in. (83.044 − 92.083 N.m).
(9) Connect hoist to lifting rings on top cover of container, and position top cover over bottom half of container. Align dowel pins with dowel pin holes and lower top cover onto bottom half of container.
(10) Secure container using detail bolts and nuts.
(11) Install lockwire, MS20995−C41 through holes in cover flange and attach Lead Seal (P05−156). Using bulldog pliers, compress seal on wire and cut off excess wire.
(12) Inspect condition of Dehydrator (P15−001) and replace as required.

LOW PRESSURE COMPRESSOR (LPC) − STORAGE−01

Task 72−31−00−540−001:

2. Unpack Low Pressure Compressor (LPC)
   - A. Equipment And Materials Required

     Special Tools:
     PWA 28657 Sling
     PWA 76154 Adapter (Two Necessary)
     PWA 85520 Fixture
     PWA 85660 Stand, Storage (Optional to PWA 88183)
     PWA 88183 Stand, Build/Storage

   - B. Procedure
     - (1) Break and remove lockwire and seal from container flange.
     - (2) Remove top half of P60040 Container Assembly.
       - (1) Actuate relief valve on side of container to release pressure before opening container.
       - (a) Loosen nuts securing container flange bolts, and rotate bolts 1/4 turn.
       - (b) Connect suitable sling to lifting rings on top cover of container. Using hoist, remove top cover of container.
     - (3) Remove hex head nut (1202/2), lockwasher (1202/3) and flat washer (1202/4) securing upper support (1202/1) to lower support (1202/5) of container.
     - (4) Using suitable sling, lift upper support (1202/1) from lower support (1202/5).
     - (5) Remove 24 cap screws (1202/7), lockwashers (1202/8) and flat washers (1202/8) securing LPC case to lower support.
     - (6) Install PWA 85520 Fixture onto LPC. See Figure 1201.
       - (a) Using PWA 76154 Adapters, PWA 28657 Sling, and a hoist, raise PWA 85520 Fixture.
       - (b) Position fixture to LPC and secure to LPC hub using 19 bolts (1201/1) and to shroud using six clamps (1201/2).
     - (7) Using hoist, remove LPC from container.
     - (8) Place LPC rear end down into PWA 88183 or PWA 85660 Storage Stand. See Figure 1201.
     - (9) Remove fixture from LPC.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Task 72-31-01-040-001:

1. Disassemble The Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

	PWA 85086	Arm, Lift (2 Necessary)
	PWA 85621	Eye, Lifting, Front (For Hub Only) (Optional to PWA 87221)
	PWA 85622	Eye, Lifting, Rear (For Hub Only) (Optional to PWA 87266)
	PWA 85628	Fixture, Lifting
	PWA 85660	Stand (Optional to PWA 88183)
	PWA 86133	Drift, Tab Bending (Optional to PWA 105331)
	PWA 86134	Drift, Tab Bending (Optional to PWA 105331 and PWA 105332)
	PWA 86534	Fixture, Lifting
	PWA 87221	Eye, Lifting, Front (For Hub Only) (Optional to PWA 88748)
	PWA 87266	Eye, Lifting, Rear (For Hub Only) (Optional to PWA 86534)
	PWA 88183	Stand (Optional to PWA 85660)
	PWA 88748	Adapter, Lift And Turn (For Hub/HPC Rotor)
R	PWA 104359	Puller, Jackscrew
	PWA 105330	Kit, Tab Bending
R	PWA 106333	Guide, Drill

(The tools that follow are contained in this kit)
*PWA 105331 Drift, Tab Bending
*PWA 105332 Drift, Tab Bending
*PWA 105333 Drift, Tab Bending

B. Procedure

NOTE: The axial compressor rotor assembly is rear end down in PWA 88183 Stand or PWA 85660 Stand.

(1) Remove the hub as follows. See Figure 501.

(a) If not already done, install knife-edge protectors on the drum rotor knife-edge seals.

(b) Remove the balance counterweights, if any, from the hub.

(c) Remove the 38 nuts that attach the hub to the drum rotor.

(d) Move the slide clamps of the PWA 104359 Jackscrew Puller to center of puller. Attach a lift sling and hoist to the lift eyes of puller. Position puller on the hub so that the jackscrew pads touch the drum rotor flange. Remove sling and hoist.

(e) Move and engage the clamps in the hub. Tighten knurled knobs to lock clamps in position. Use an opposite pattern and tighten each jackscrew approximately one−half turn each until the hub is disengaged.

(f) Attach a lift sling and hoist to the lift eyes of (PWA 104359) puller. Loosen the knurled knob and move the slide clamps to center of puller. Remove the puller from the hub.

(g) Thread either PWA 87221 Eye or PWA 85621 Eye or PWA 88748 Adapter into the ID of the hub.

(h) Attach a hoist to the eye and lift the hub from the drum rotor. If removal of the hub is difficult, tap the front flange of the drum rotor with a mallet and fiber drift. Put the hub away. Remove the eye.

NOTE: To trunnion the hub, use either PWA 87266 Eye or PWA 85622 Eye.

(2) Remove the Stage 1.6 blades from the drum rotor as follows.

(a) Locally fabricate segmented protectors to be installed over LPC blades, Stages 2 and 4, to protect the blades from dropped objects.

(b) Install locally fabricated blade protector on 2nd stage blades.

(c) Straighten smaller bent end of 1.6 stage blade locks using PWA 86134 or PWA 105331 Tab Bending Drift and plastic mallet.

(d) Remove 1.6 stage blade locks.

(e) Remove 1.6 stage blades. If necessary, tap rear of blade, at blade root, using small mallet and fiber drift.

(3) Remove the Stage 3 blades from the drum rotor as follows.

(a) Install locally fabricated blade protector on 4th stage blades.

(b) Straighten smaller bent end of 3rd stage blade locks using PWA 86134 or PWA 105332 Tab Bending Drift and plastic mallet.

(c) Remove 3rd stage blade locks.

(d) Remove 3rd stage blades. If necessary tap forward end of blade, at blade root, using mallet and fiber drift.

(4) Remove the Stage 4 blades from the drum rotor as follows.

(a) Use the PWA 105333 Tab Bending Drift and a plastic mallet to make the smaller bent end of the 4th stage blade locks straight.

(b) Remove the 4th stage blade locks.

(c) Lift the PWA 85628 Fixture with a hoist. Attach the fixture to the front flange of the drum rotor with the detail screws and nuts.

(d) Install the PWA 85086 Arm to the eye of the fixture with the detail nut and pin. Attach a hoist to the arm. Lift the drum rotor sufficiently to permit 4th stage blade removal.

(e) Remove 4th stage blades. If necessary tap forward end of blade, at the blade root, use a mallet and a fiber drift.

(5) Trunnion the drum rotor to front end down as follows. See Figure 502.

(a) Clamp PWA 86534 Fixture to the rear flange of the drum rotor.

(b) Install PWA 85086 Arm in the eye in the rear fixture. Attach a hoist to the arm. Trunnion the drum rotor to front end down. Remove the hoist and arm from the front fixture and lower the drum rotor onto the PWA 88183 Stand or PWA 85660 Stand.

(6) Remove the Stage 2 blades as follows.

(a) Straighten smaller bent end of 2nd stage blade locks using PWA 86133 or PWA 105331 Tab Bending Drift and plastic mallet.

(b) Remove 2nd stage blade locks.

(c) Remove 2nd stage blades. As necessary tap forward end of blade, at blade root, using mallet and fiber drift.

(7) Remove the balance counterweights, if any, from the
R drum rotor rear flange only. Use PWA 106333 Drill
R Guide to remove the rotor balance weight rivet. See
R Figure 502 (Sheet 2).

R (a) Install the locator details for the wide or narrow
R counterweight as applicable.

R NOTE: The locator details are designed for the
R two counterweight widths.

R (b) Set the stop on the drill using the "DRILL SET−UP
R GAGE" on the side of the frame

R (c) Install the Guide around the counterweight with
R the handle parallel to the flange of the drum.

R (d) Install the detail drill to help align the guide
R to the center of the rivet. Tighten the hex bolt
R against the counterweight.

R NOTE: You can use the slot in the end of the hex
R head bolt to make sure that the dill is
R aligned with the center of the rivet

R (e) Remove the drill detail.

R (f) Install the drill into the drill motor.

R (g) Install the drill into the Guide.

R (h) Actuate the drill motor until the drill stop contacts the stop contacts the hex bolts.

R (i) Remove the drill from the Guide.

R (j) Install the drift into the Guide

R (k) Use a hammer to hit the drift until the rivet is removed.

R (l) Loosen the hex bolt and remove the Guide.

(8) Trunnion the drum rotor to rear end down as follows.

(a) Raise the drum rotor from the stand.

(b) Attach a hoist and arm to the fixture on the front of the drum rotor.

(c) Trunnion the drum rotor to rear end down. Remove the hoist, arm, and fixture from the rear flange. Lower the rotor onto the stand. Remove the hoist, arm, and fixture from the front flange.

(9) Remove the tierods as follows.

(a) Straighten the end of tierod locks.

(b) Remove each tierod lock and tierod from the flange of the drum rotor.

(10) Install PWA 85628 Fixture on the front flange of the drum rotor. With a hoist and PWA 85086 Arm, remove the drum rotor from the stand. Put the drum rotor on storage rack. Remove the hoist, arm, and fixture.

AXIAL COMPRESSOR ROTOR ASSEMBLY - INSPECTION/CHECK-00

Task 72-31-01-990-001:

1. Inspection/Check Part Number Index - Axial Compressor Rotor Assembly
   A. Inspection Functional Arrangement
      (1) Inspection/Check-01 through Inspection/Check-06 contain procedures for complete inspection of rotor. Inspection function and applicability for this part are shown in Table 801.

INSPECTION/CHECK NUMBER	INSPECTION/CHECK CATEGORY	INSPECTION/CHECK APPLICABILITY
-01	Preinspection Preparation	Not Applicable
-02	Non-destructive Inspection	Not Applicable
-03	Visual Inspection	Applicable
-04	Dimensional Inspection	Not Applicable
-05	Functional Check Inspection	Not Applicable
-06	Inspection Postrequisites	Not Applicable

Inspection Functional Arrangement
Table 801

   B. Inspection/Check Part Number Index
      (1) Table 802 is a listing of part numbers and appropriate Inspection/Check numbers. Referenced service bulletins are listed for parts introduced or obtained by service bulletin incorporation.

PART NUMBER	INSPECTION/CHECK	SERVICE BULLETIN
See Note	03	None

NOTE: Subassembly is made up of details 72-31-03, 72-31-04, 72-31-05, 72-31-06, 72-31-07 and 72-31-08.

Inspection/Check Part Number Index
Table 802

AXIAL COMPRESSOR ROTOR ASSEMBLY - INSPECTION/CHECK-03

Task 72-31-01-200-003:

1. Visual Inspection - Axial Compressor Rotor Assembly
   A. Prerequisites
      (1) See Inspection/Check-00 (Task 72-31-01-990-001) for functional arrangement and part number applicability.
   B. Equipment And Materials Required - None
   C. Procedure
      See Figure 801.
      (1) Accomplish inspection requirements in this section whenever extent of engine disassembly permits. It is not necessary to remove any parts for the purpose of inspection unless inspection reveals that additional disassembly is required.
      (2) Low compressor rotor assemblies that pass all inspection/check requirements may be returned to service. Assemblies that do not pass inspection requirements must be in accordance with applicable section of this manual.
      (3) Visually inspect the part for obvious surface damage and/or deformations which will preclude proper functioning of the part. The inspection can be enhanced by using fluorescent (white) light and a 3X magnifying glass.

Subtask 72-31-01-220-051:
      (4) Visually inspect fan hub for cracks, nicks, dents, scratches or corrosion pits. Check security of counterweights and for surface damage to spline or threads.

Subtask 72-31-01-220-052:
      (5) Visually inspect compressor blades for indications of excessive blade rub, curled tips, excessive looseness, foreign object damage, and excessive erosion. Check security of silicone rubber sealant around drum rotor blade slots.

Subtask 72-31-01-220-053:
      (6) Visually inspect drum rotor for cracked or bent knife-edge seals. Visually inspect all accessible surfaces for cracks, nicks, dents, scratches or corrosion pits.

Subtask 72-31-01-220-054:
      (7) Visually inspect tierod nuts and bolts security of attachment. Visually inspect for damaged threads.

Subtask 72-31-01-220-055:
      (8) Visually inspect for broken, missing or loose bladelocks.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-01

Task 72-31-01-440-001:

1. Assemble Axial Compressor Rotor Assembly (Stage 2)

A. Prerequisites

(1) See Inspection/Check-04, Task 72-31-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

	PWA 78227	Bender, Tierod Lock
	PWA 80673	Crimper, Tierod Lock
	PWA 85086	Lift Arm (2 Required)
	PWA 85189	Crimper, Manual
	PWA 85628	Fixture, Lifting
	PWA 85645	Gage, Go-No Go
	PWA 85660	Stand, Build/Storage (Optional to PWA 88183)
R R	PWA 85958	Bender, Pneumatic (Blade Lock) (Optional to PWA 85189, PWA 106228 and PWA 106229)
	PWA 86534	Fixture, Lifting
	PWA 88183	Stand, Build/Storage
	PWA 101562	Riveter, Manual
R R	PWA 106228	Bender, Pneumatic (Blade Lock) (Initial Bend)
R R	PWA 106229	Bender, Pneumatic (Blade Lock) (Final Bend)

Consumable Materials:

Item No.	Designation
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	38	72-31-00/5/20
Lock	88	72-31-00/5/100
Rivet	0 - 6	72-31-00/5/4

C. Procedure
Figure 1001

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-01

(1) Install PWA 85628 Lifting Fixture on front flange of drum rotor using hoist. Secure fixture to flange.

(2) Raise drum rotor from storage rack and place on PWA 88183 Build Stand or PWA 85660 Build Stand front end up. Remove hoist and fixture.

(3) Install tierod in front flange of drum rotor. Install tierod lock (from right to left) slot of tierod head while holding tierod against rear face of flange. See Figure 1002. Install remaining tierods.

(4) Bend tierod locks with PWA 78227 Bender or PWA 80673 Crimper. See Figure 1002.

(5) Install PWA 85628 Lifting Fixture on front flange of drum rotor using hoist. Secure fixture to flange. Remove hoist and install PWA 85086 Arm to eye on fixture. Attach hoist and raise drum rotor.

(6) Install PWA 86534 Lifting Fixture on rear (bottom) of drum rotor. Clamp fixture to rear of drum. Install PWA 85086 Arm to eye on fixture. Attach hoist and trunnion drum rotor to tierod end down. Remove lower hoist, arm and fixture from drum rotor.

(7) Lower drum rotor to PWA 85660 Build Stand. Remove hoist, arm and fixture from upper flange of drum rotor.

(8) If necessary, install the drum balance counterweights to the drum rotor rear flange ID. Make sure you install the counterweights to their initial location. Use PWA 101562 Manual Riveter to install the rivet. See Figure 1001 (Sheet 2).

NOTE: The part number and class of the balance weight is marked on the drum rotor to the right of the rivet hole.

CAUTION: PN 50B902 AND PN 50B202 STAGE 2 LPC BLADES ARE INTERCHANGEABLE IN ANY COMBINATION WITH LPC COMPRESSOR STATOR ASSEMBLIES PN 54B016 OR PN 54B916 OR PN 56B016 OR PN 56B116.

(9) Prior to installation, weigh the 2nd stage blades.

R
R

(10) Ink mark the 2nd stage blade weight on the individual airfoils with a suitable ink marker. See Standard Practices Manual, PN 585005, "Marking Of Parts" 70−11−00.

(11) Arrange 2nd stage blades in four columns of 22 blades, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom right (Column 4). See Figure 1003.

(12) Prior to applying compound, wipe blade areas to be sealed by SPOP 208 Wipe Method Task, Standard Practices Manual, PN 585005, 70−21−00−110−040.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF BLADES. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(13) Starting with lightest (bottom) blade in Column 4, apply Silicone Rubber P09−014, to blade root in areas shown in Figure 1004, and install blade, leading edge down in drum slot.

(14) Grasp blade and pull radially outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(15) Remove excess compound from blade lock area and around blade root area. Fill in any voids.

(16) Install blade lock in hole formed by blade and drum per Figure 1005.

(17) Repeating compound application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in a clockwise direction. Install blade lock after installing each blade.

(18) After all blades in Column 4 are installed, move to bottom of Column 2, repeat compound application procedure and install blades from Column 2, selecting blades vertically upward from lighter blades to heavier blades. Install blades in a clockwise direction. Secure each blade with blade lock.

(19) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat compound application and blade installation procedures.

(20) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat compound application and blade installation procedures.

R (21) Bend the locks as follows: See Figure 1004.

R NOTE: See the following step to bend the locks with PWA 106228 Bender (initial) and PWA 106229 Bender (final).

R (a) With PWA 85958 Bender or PWA 85189 Crimper, bend locks (to retain blades) to 0.135 inch (3.429 mm) minimum.

R (b) Check dimension with PWA 85645 Gage.

R (22) Bend the locks as follows:

R (a) Attach an air supply to the quick disconnect plug on PWA 106228 Bender.

R (b) Put the stationary jaw of the Bender on the manufactured bend of the blade lock.

R (c) Apply pressure to the stationary jaw to hold the blade lock in position.

R (d) Push the lever on the handle to move the movable jaw detail to make the initial bend on the blade lock.

R (e) Repeat the preceding steps but use the PWA 106229 Bender to make the final bend on the blade lock.

R (f) Check dimension with PWA 85645 Gage. The bend to retain blades must be 0.135 inch (3.429 mm) minimum.

R (23) Allow sealant to cure at 22 percent minimum relative humidity and at room temperature for 4 hours prior to balance and 24 hours minimum (total time) prior to engine test.

R (24) Install PWA 86534 Lifting Fixture to top (rear) of drum rotor. Clamp fixture to drum. Install PWA 85086 Arm to eye on fixture. Attach hoist and raise drum rotor.

R (25) Install PWA 85628 Lifting Fixture to bottom (front) of drum rotor. Secure fixture to flange. Install PWA 85086 Arm to eye on fixture. Attach hoist and trunnion drum rotor to tierod end up. Remove bottom hoist, arm and fixture from drum rotor.

R (26) Lower drum rotor to PWA 85660 Build Stand. Remove hoist, arm and fixture from drum.

D. Postrequisites

(1) Assemble axial compressor rotor assembly (Stage 4). See Assembly−02 Task 72−31−01−440−002.

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	66	72-31-00/5/140

C. Procedure

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−02

CAUTION: THE FOLLOWING STAGE 4 LPC BLADES AND 4TH STAGE DUCTS MUST BE ASSEMBLED IN SETS ONLY OR BLADE, RUBSTRIP AND SHROUD DAMAGE MAY OCCUR.

CAUTION: PN 51B104 STAGE 4 LPC BLADES MUST BE ASSEMBLED WITH PN 50B023 4TH STAGE DUCT.

CAUTION: PN 51B404 STAGE 4 LPC BLADES CAN BE ASSEMBLED WITH PN 50B227, PN 50B023−001 OR PN 50B023 4TH STAGE DUCT.

CAUTION: THE ABOVE SETS ARE INTERCHANGEABLE WITH PN 54B016 OR PN 54B916 OR PN 56B016 OR PN 56B116 LPC COMPRESSOR STATOR ASSEMBLIES.

(1) Prior to installation, weigh the 4th stage blades.

(2) Ink mark the 4th stage blade weight on the individual airfoils with a suitable ink marker. See Standard Practices Manual, PN 585005, "Marking Of Parts" 70−11−00.

(3) Arrange the 4th stage blades as follows. See Figure 1001.

  (a) Arrange the blades in four columns.

  (b) Start with the heaviest blade at top left Column 1.

  (c) Continue from left to right, in descending order of weight.

  (d) The lightest blade will be at the bottom of Column 2.

(4) Clean the areas of the blades that will have sealant on them. Use the SPOP 208 Wipe Method, Standard Practices Manual, PN 585005, 70−21−00−110−040. Refer to Figure 1002 for sealant areas.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF BLADES. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(5) Apply Sealant P09−014 to the lightest (bottom) blade in Column 4.

- (a) Make it sufficiently thick to fill the empty space between Parts K and L when assembled.
- (b) Install the blade before the sealant cures.

(6) Install the blade in the drum rotor disk assembly as follows.

- (a) Install the blade, leading edge up, in the slots of the disk assembly.
- (b) Hold the blade radially outward while you install it.

  NOTE: This loads the blade against the bearing surface of the disk slot. It also makes sure that the layer of sealant is equally applied along the platform of the blade.

- (c) Slowly seat the blade fully in the disk assembly.
- (d) If there is too much sealant in the area of the blade lock, remove it. Fill any empty spaces.

(7) Install a blade lock in the hole made by the blade and the disk assembly. Refer to Figure 1003.

(8) For each blade, apply Sealant P09−014 to the blade, install the blade, then install the blade lock. Install the blades in the sequence that follows.

- (a) Install the blades in a counterclockwise direction.
- (b) Install the remaining blades from Column 4. Start at the bottom of the column and go to the top of the column (lighter blades to heavier blades).

(c) Install the blades in Column 2. Start at the bottom of the column and go to the top of the column.

(d) Install the blades in Column 3. Start at the bottom of the column and go to the top of the column.

(e) Install the blades in Column 1. Start at the bottom of the column and go to the top of the column.

R (9) Bend the locks as follows: See Figure 1003.

R NOTE: See the following step to bend the locks with
R PWA 106299 Bender (initial) and PWA 106300
R Bender (final).

R (a) With PWA 85959 Bender or PWA 85188 Crimper, bend locks (to retain blades) to 0.135 inch (3.429 mm) minimum.

R (b) Check dimension with PWA 87948 Gage.

R (10) Bend the locks as follows:

R (a) Attach an air supply to the quick disconnect plug
R on PWA 106299 Bender.

R (b) Put the stationary jaw of the Bender on the
R manufactured bend of the blade lock.

R (c) Apply pressure to the stationary jaw to hold the
R blade lock in position.

R (d) Push the lever on the handle to move the movable
R jaw detail to make the initial bend on the blade
R lock.

R (e) Repeat the preceding steps but use the PWA 106300
R Bender to make the final bend on the blade lock.

R (f) Check dimension with PWA 85645 Gage. The bend
R to retain blades must be 0.135 inch (3.429 mm)
R minimum.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−02

R (11) Cure the sealant in room temperature air that is at 25 percent minimum relative humidity. Cure the sealant for eight hours before you balance the assembly. Cure the sealant for 24 hours, minimum, before engine test.

D. Postrequisites

(1) Assemble axial compressor rotor assembly (Stage 3). See Assembly−03 Task 72−31−01−440−003.

Task 72-31-01-440-003:

1. Assemble Axial Compressor Rotor Assembly (Stage 3)

A. Prerequisites

(1) Assemble axial compressor rotor assembly (Stage 4). See Assembly-02 Task 72-31-01-440-002.

B. Equipment And Materials Required

Special Tools:

	PWA 85188	Pliers, Crimper
	PWA 85567	Gage, Go-No Go (Optional to PWA 87948 Gage)
R	PWA 85959	Bender, Pneumatic (Blade Lock) (Optional PWA 106301 And PWA 106302)
	PWA 87948	Gage, Go-No Go
R	PWA 106301	Bender, Pneumatic (Blade Lock) (Initial Bend)
R	PWA 106302	Bender, Pneumatic (Blade Lock) (Final Bend)

Consumable Materials:

Item No.	Designation
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	72	72-31-00/5/120

C. Procedure

CAUTION: PN 50B203 AND PN 50B903 STAGE 3 LPC BLADES ARE INTERCHANGEABLE IN ANY COMBINATION WITH LPC COMPRESSOR STATOR ASSEMBLIES PN 54B016 OR PN 54B916 OR PN 56B016 OR PN 56B116.

(1) Prior to installation, weigh the 3rd stage blades.

(2) Ink mark the 3rd stage blade weight on the individual airfoils with a suitable ink marker. See Standard Practices Manual, PN 585005, "Marking Of Parts" 70-11-00.

(3) Arrange the 3rd stage blades in four columns of 18 blades, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom right (Column 4). See Figure 1001.

(4) Prior to applying compound, wipe blade areas to be sealed by SPOP 208 Wipe Method. See 70−21, Standard Practices Manual, PN 585005.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF BLADES. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(5) Starting with lightest (bottom) blade in Column 4, apply Silicone Rubber P09−014, to blade root in areas shown in Figure 1002, and install blade, leading edge up in drum slot.

(6) Grasp blade and pull radially outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(7) Remove excess compound from blade lock area and around blade root area. Fill in any voids.

(8) Install blade lock in hole formed by blade and drum per Figure 1003.

(9) Repeating compound application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in a counterclockwise direction. Install blade lock after installing each blade.

(10) After all blades in Column 4 are installed, move to bottom of Column 2, repeat compound application procedure and install blades from Column 2, selecting blades vertically upward from lighter blades to heavier blades. Install blades in a counterclockwise direction. Secure each blade with blade lock.

(11) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat compound application and blade installation procedures.

(12) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat compound application and blade installation procedures.

(13) Bend the locks as follows: See Figure 1003.

NOTE: See the following step to bend the locks with PWA 106301 Bender (initial) and PWA 106302 Bender (final).

(a) With PWA 85959 Bender or PWA 85188 Crimper, bend locks (to retain blades) to 0.135 inch (3.429 mm) minimum.

(b) Check dimension with PWA 87948 Gage.

(14) Bend the locks as follows:

(a) Attach an air supply to the quick disconnect plug on PWA 106301 Bender.

(b) Put the stationary jaw of the Bender on the manufactured bend of the blade lock.

(c) Apply pressure to the stationary jaw to hold the blade lock in position.

(d) Push the lever on the handle to move the movable jaw detail to make the initial bend on the blade lock.

(e) Repeat the preceding steps but use the PWA 106302 Bender to make the final bend on the blade lock.

(f) Check dimension with PWA 85645 Gage. The bend to retain blades must be 0.135 inch (3.429 mm) minimum.

(15) Allow sealant to cure at 22 percent minimum relative humidity and at room temperature for 8 hours prior to balance and 24 hours minimum (total time) prior to engine test.

D. Postrequisites

(1) Assemble axial compressor rotor assembly (Stage 1.6). See Assembly−04 Task 72−31−01−440−004.

C. Procedure

CAUTION: PN 53B516 AND PN 55B116 STAGE 1.6 LPC BLADES ARE INTERCHANGEABLE IN ANY COMBINATION WITH LPC COMPRESSOR STATOR ASSEMBLIES PN 54B016 OR PN 54B916 OR PN 56B016 OR PN 56B116.

(1) Prior to installation, weigh the 1.6 stage blades.

(2) Ink mark the 1.6 stage blade weight on the individual airfoils with a suitable ink marker. See Standard Practices Manual, PN 585005, "Marking Of Parts" 70-11-00.

(3) Arrange 1.6 stage blades in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of (Column 2). See Figure 1001.

(4) Prior to applying compound, wipe blade areas to be sealed by SPOP 208 Wipe Method. See 70−21, Standard Practices Manual, PN 585005.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF BLADES. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(5) Starting with lightest (bottom) blade in Column 4, apply Silicone Rubber P09−014, to blade root in areas shown in Figure 1002, and install blade, leading edge up in drum slot.

(6) Grasp blade and pull radially outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(7) Remove excess compound from blade lock area and around blade root area. Fill in any voids.

(8) Install blade lock in hole formed by blade and drum per Figure 1003.

(9) Repeating compound application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in a counterclockwise direction. Install blade lock after installing each blade.

(10) After all blades in Column 4 are installed, move to bottom of Column 2, repeat compound application procedure and install blades from Column 2, selecting blades vertically upward from lighter blades to heavier blades. Install blades in a counterclockwise direction. Secure each blade with blade lock.

(11) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat compound application and blade installation procedures.

(12) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat compound application and blade installation procedures.

R (13) Bend the locks as follows: See Figure 1003.

R NOTE: See the following step to bend the locks with PWA 106301 Bender (initial) and PWA 106302 Bender (final).

R (a) With PWA 85959 Bender or PWA 85188 Crimper, bend locks (to retain blades) to 0.135 inch (3.429 mm) minimum.

R (b) Check dimension with PWA 87948 Gage.

R (14) Bend the locks as follows:

R (a) Attach an air supply to the quick disconnect plug on PWA 106301 Bender.

R (b) Put the stationary jaw of the Bender on the manufactured bend of the blade lock.

R (c) Apply pressure to the stationary jaw to hold the blade lock in position.

R (d) Push the lever on the handle to move the movable jaw detail to make the initial bend on the blade lock.

R (e) Repeat the preceding steps but use the PWA 106302 Bender to make the final bend on the blade lock.

R (f) Check dimension with PWA 85645 Gage. The bend to retain blades must be 0.135 inch (3.429 mm) minimum.

R (15) Allow sealant to cure at 22 percent minimum relative humidity and at room temperature for 8 hours prior to balance and 24 hours minimum (total time) prior to engine test.

D. Postrequisites

(1) Assemble hub to drum rotor and check runout. See Assembly−05 Task 72−31−01−440−005.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-05

Task 72-31-01-440-005:

1. Assemble Hub To Drum Rotor And Check Runout

A. Prerequisites

(1) Assemble axial compressor rotor assembly (Stage 1.6). See Assembly-04 (Task 72-31-01-440-004).

B. Equipment And Materials Necessary

Special Tools:

PWA 29754	Controller
PWA 85183	Fixture, Angle Of Turn
PWA 85185	Heater
PWA 85086	Arm, Lift (2 Required)
PWA 85586	Eye, Handling
PWA 85621	Eye, Lifting, Front (For Hub Only) (Optional To PWA 87221)
PWA 85622	Eye, Lifting, Rear (For Hub Only) (Optional To PWA 87266)
PWA 85684	Arbor, Balancing (Optional To PWA 85695)
PWA 85695	Arbor, Balance (Optional To PWA 87037)
PWA 86534	Fixture, Lifting
PWA 86545	Stand, Transportation
PWA 87037	Arbor, Balance
PWA 87135	Adapter, Lift
PWA 87163	Cover, Protective
PWA 87221	Eye, Lifting, Front (For Hub Only) (Optional To PWA 88748)
PWA 87266	Eye, Lifting, Rear (For Hub Only)
PWA 88748	Adapter, Lift And Turn (For Hub/HPC Rotor)

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
R	P06-054	Paste, Antiseize (PWA 36246)

C. Procedure

(1) Install PWA 85185 Heater on front flange of drum rotor. Connect heater to PWA 29754 Controller. Heat flange to 200°F (93°C).

(2) Using hoist and PWA 85086 Lift Arm, install either PWA 87221 or PWA 85621 Eye or PWA 88748 Adapter on front compressor hub assembly.

NOTE: If hub is front face down, use either PWA 87266 or PWA 85622 Eye along with PWA 85586 Eye to access hub front face.

(3) When temperature of hub flange is achieved, shut off controller and remove heater from drum.

(4) Raise hub and position high point runout on hub 180 degrees from high point runout on drum. Install onto heated drum aligning tierods with tierod holes. Seat hub on drum rotor. Remove tooling from hub. See Figure 1001.

R R (5) Apply Antiseize Paste P06−054, to threads of tierods, nuts and washer face of nuts. Wipe off unwanted paste. Remove excess lubrication.

(6) Install tierod nuts, noting run−on torque, as each nut is assembled. Replace nut if run−on torque is less than 9 lb−in. (1.017 N.m).

(7) (Reference 1660) Torque tierod nuts as follows:

(a) Torque nuts in sequence as specified in Figure 1002 to 130 − 150 lb−in. (14.688 − 16.948 N.m) plus run−on torque noted for each nut.

(b) Repeat step (a).

(c) Verify maximum torque using tightening sequence specified in figure. Repeat until nuts do not turn anymore.

(d) Loosen nuts and retorque, one pair at a time to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus noted run−on torque and apply 52 − 56 degree angle of turn using PWA 85183 Fixture.

(8) If necessary, the drum rotor and hub may be trunnioned to the front end down position as follows:

(a) Install PWA 88748 Adapter to the hub and install PWA 85086 Arm to the adapter.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−05

(b) Install PWA 86534 Fixture to the rear flange of the drum and install PWA 85086 Arm to the fixture.

(9) Install the balance arbor to the LPC hub and drum rotor assembly.

NOTE: The hub and drum rotor assembly is in the front end up position.

(a) For PWA 85684 or PWA 85695 Balance Arbors.

1 Attach a hoist to the eye on the arbor. Lift the arbor over the hub and drum rotor assembly and carefully lower the arbor to engage the hub/arbor splines.

2 Attach the hub to the balance arbor using detail retaining nut lubricated with Engine Oil P03−001, and hydraulic actuation screw. Torque nut to 800 − 1200 lb−in. (90.388 − 135.582 N.m) with two standard one−half inch square drive torque wrenches.

(b) For PWA 87037 Balance Arbor.

1 Install PWA 87135 Adapter to the hub and drum rotor assembly. Attach the adapter to the front face of the hub.

2 Lift PWA 87135 Adapter with the hub and drum rotor assembly and install the assembly to PWA 87037 Arbor.

3 Remove PWA 87135 Adapter from the hub and drum rotor assembly.

4 Install PWA 87163 Protective Covers over the hub and drum rotor assembly to prevent damage to the assembly.

5 Attach the hub to the balance arbor using detail retaining nut lubricated with Engine Oil P03−001, and hydraulic actuation screw. Torque nut to 800 − 1200 lb−in. (90.388 − 135.582 N.m) with detail adapter wrench and a standard one−half inch square drive torque wrench.

6 Remove PWA 87163 Protective Covers.

R
R

(10) Raise arbor and hub/drum assembly from build stand. Attach PWA 85086 Lift Arm to eye on other end of arbor. Using hoist, trunnion assembly to horizontal position.

(11) Lower assembly onto balance machine. Secure arbor to machine.

(12) Check runout at bore of Stage 4 disk. Runout shall not exceed 0.010 inch (0.254 mm) FIR. Drum may be rotated on hub to meet this requirement. See Figure 1001.

(13) If you want to put away the axial compressor rotor assembly before you balance it, install it with the arbor installed in PWA 86545 Stand.

D. Postrequisites

(1) Balance LPC rotor (fan blades not included). See Assembly−06 (Task 72−31−01−440−006).

Task 72-31-01-440-006:

1. Balance LPC Rotor (Fan Blades Not Included)

A. Prerequisites

(1) Assemble hub to drum rotor and check runout. See Assembly-05 Task 72-31-01-440-005.

B. Equipment And Materials Necessary

Special Tools:

PWA 28375	Riveter
PWA 85174	Shroud (Optional to PWA 86526 and PWA 86529)
PWA 85086	Arm (2 Necessary)
PWA 85184	Stand (Optional to PWA 87111)
PWA 85587	Weight, Calibration (Check Weight)
PWA 85588	Weight, Calibration (Check Weight)
PWA 86526	Shroud (Optional to PWA 85174 and 86529)
PWA 86529	Shroud (Optional to PWA 85174 and 86526)
PWA 86545	Stand
PWA 87111	Stand, Installation

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	0-10	72-31-00/5/60

C. Procedure

NOTE: If the rotor assembly is in a stand, remove the assembly and install it in a balance machine.

(1) With rotor assembly in balance machine, attach arbor to balance machine with either belt drive or end drive.

(2) Install PWA 85174 Shroud, PWA 86526 Shroud, or PWA
R 86529 Shroud, or suitable shroud to balance machine base.

(3) Operate the dynamic balance machine.

(a) Find the dynamic unbalance of the compressor hub and drum rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(4) Remove the arbor and the compressor hub and drum rotor assembly from the balance machine and turn the arbor on the rotor assembly 180 degrees from the original location as follows.

(a) Remove the belt drive or the end drive from the arbor assembly.

(b) Attach a hoist and PWA 85086 Lifting Arm to each eye of the balance arbor and lift the rotor assembly from the balance machine.

(c) Turn the assembly to a vertical position and remove the lower hoist and lifting arm. Lower the assembly to the build stand.

(d) Make a reference mark on the hub of the drum rotor, the shaft of the arbor and the spline with a Marker P05-045 to identify the original location.

(e) Remove the arbor from the rotor assembly. Refer to Assembly-09, (Task 72-31-01-440-009).

(f) Turn the arbor 180 degrees from the original location and lower the arbor to the rotor assembly.

(g) Attach the arbor to the rotor assembly. Refer to Assembly-05, (Task 72-31-01-440-005).

(h) Attach a hoist and PWA 85086 Lifting Arm to the upper eye of the balance arbor. Lift the rotor and arbor assembly from the build stand.

(i) Attach a hoist and PWA 85086 Lifting Arm to the lower eye of the balance arbor. Trunnion the assembly to a horizontal position.

(j) Lower the assembly to the balance machine. Attach the arbor to the balance machine with either a belt drive or end drive.

(5) Dynamic balance the compressor hub and drum rotor assembly.

  (a) Find the dynamic unbalance of the compressor hub and drum rotor assembly while the assembly turns at 900 rpm minimum.

  (b) The initial unbalance must not to be more than 15.0 oz−in. (10800.0 g.mm) for the front plane and 15.0 oz−in. (10800.0 g.mm) for the rear plane if the unbalance vectors are not within 30 degrees of each other. However, if the unbalance vectors are within 30 degrees of each other, the initial unbalance must not be more than 7.5 oz−in. (5400.0 g.mm) for the front plane and 7.5 oz−in. (5400.0 g.mm) for the rear plane.

  (c) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

  (d) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(6) Balance the assembly to get a remaining unbalance of 1.0 oz−in. (720.0 g.mm) maximum in the front and rear planes.

  (a) Residual unbalance must not be more than 1.0 oz−in. (720.0 g.mm) in the front plane and must not be more than 1.0 oz−in. (720.0 g.mm) in the rear plane.

  (b) Correct the residual unbalance in the front plane (Plane J) by adding any combination of PN 534493 and PN 534495 Counterweights, up to a maximum of ten. See Figure 1001.

  (c) Correct the residual unbalance in the rear plane (Plane H) by adding any combination of PN 534493 and PN 534495 Counterweights, up to a maximum of ten. See Figure 1001.

(d) Install the counterweights and rivets to the rivet holes and hold in position with Pressure Sensitive Sealing Tape P05−323.

(7) Record the angle and the amount of assembly unbalance in the front and rear planes.

(8) Optional process based on the experience of the operator, do a check of the dynamic balance machine as follows:

(a) Install the PWA 85587 Calibration Weight (Check Weight) to Plane J (compressor hub front flange) as close as possible to the heavy angle.

NOTE: Do not install a check weight at a location where a counterweight is installed.

(b) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the front plane.

1 The check weight on the front plane pulls 4.0 oz−in. (2880.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the front plane.

3 The amount of unbalance in the front plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the front plane.

(c) Install the PWA 85588 Calibration Weight (Check Weight) to Plane H (drum rotor rear flange) as close as possible to the heavy angle.

(d) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the rear plane.

1 The check weight on the rear plane pulls 4.0 oz−in. (2880.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the rear plane.

3 The amount of unbalance in the rear plane should agree in ± 0.4 oz-in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the rear plane.

(e) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the dynamic balance machine.

(9) Attach the counterweights in Plane J and Plane H with the installed rivets as follows.

(a) Flare the rivets on Plane J (compressor hub front flange) with the PWA 28375 Hand Riveter to 0.125 inch (3.175 mm) diameter minimum.

(b) Flare the rivets on Plane H (drum rotor rear flange) with the PWA 28375 Hand Riveter to 0.125 inch (3.175 mm) diameter minimum.

(10) Disconnect arbor from balance machine. Install eye to each end of arbor. Attach two PWA 85086 Arm to eyes. Install hoist on each arm and raise rotor from balance machine.

(11) Lower rotor onto PWA 87111 Stand, PWA 85184 Stand, or PWA 86545 Stand. Secure rotor in place. Remove hoist and arms from arbor.

NOTE: Use PWA 86545 Stand only if you do not install the Stage 1 LPC blades now. When you install the Stage 1 LPC blades, the axial compressor rotor assembly must be installed in either PWA 87111 Stand or PWA 85184 Stand.

D. Postrequisites

(1) Assemble the Stage 1 LPC blades to hub. See Assembly-07 Task 72-31-01-440-007.

LPC Balancing (Fan Blades Not Included)
Figure 1001
(Task 72-31-01-440-006)

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-31-01-440-007:

1. Assemble Fan Blades To Hub
   A. Prerequisites
      (1) Balance LPC rotor (fan blades not included). See Assembly-06 (Task 72-31-01-440-006).
   B. Equipment And Materials Required

      Special Tools:
      PWA 86651 Cart, Storage

      Consumable Materials:

Item No.	Designation
P06-005	Lubricant (PWA 587)

   C. Procedure

      NOTE: It is permitted as an alternative procedure not to install the rotor fan blades during this step of assembly only if the operator can do an engine trim balance. Reference 71-00-00, Testing-00, Trim Balance (Task 71-00-00-760-052).

      (1) Remove blades from PWA 86651 Cart and arrange in 19 pairs of moment weighted sets.
      (2) Install blades in hub as follows:

         WARNING: DO NOT PERMIT THE LUBRICANT (P06-005) TO TOUCH YOUR SKIN. IF IT DOES WASH IMMEDIATELY WITH SOAP AND WATER.

         (a) Brush Lubricant (P06-005) on contact faces of mid-span shroud of blades and permit to dry five minutes.
         (b) Install first blade in any hub slot. Install second blade in hub slot 180 degrees from first blade. Install first blade of second pair adjacent to previously installed pair. Install second blade of second pair 180 degrees from last installed blade. Continue installing pairs 180 degrees apart until all 38 blades are installed. See Figure 1001.
      (3) Install compressor blade (Stage 1) lock assembly as follows:
         (a) Position lock to align anti-rotation pin of lock with anti-rotation slot of hub.
         (b) Install lock starting at joint.
         (c) Seat lock using fiber drift.

Blade Arrangement On Hub
Figure 1001
(Task 72-31-01-440-007)

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-07

(d) (Reference 761) Make sure the lock is correctly installed by measurement of the gap between the lock ends. The gap must be 0.010 - 0.060 inch (0.25 - 1.52 mm). If you can not get the correct gap measurement, you must make sure the lock is fully seated.

D. Postrequisites

(1) Balance LPC rotor (fan blades included). See Assembly-08 (Task 72-31-01-440-008).

Task 72−31−01−440−008−A:

1. Balance LPC Rotor (Fan Blades Included) By Fan Blade Set Replacement

A. Prerequisites

(1) Assemble fan blades to hub. See Assembly−07 (Task 72−31−01−440−007).

B. Equipment And Materials Necessary

Special Tools:

PWA 85086	Lift Arm (2 Necessary)
PWA 85172	Weight, Calibration (Check Weight) (Optional To PWA 85587)
PWA 85174	Shroud
PWA 85184	Stand (Optional To PWA 87111)
PWA 85587	Weight, Calibration (Check Weight) (Optional To PWA 85172)
PWA 87111	Stand, Installation
PWA 102828	Mechanical Compressor (Fan Blade Lock) (Optional)

C. Procedure

NOTE: It is permitted as an alternative procedure not to install the rotor fan blades during this step of assembly only if the operator can do an engine trim balance. Reference 71−00−00, Testing−19, Trim Balance (Task 71−00−00−760−043) or (Task 71−00−00−760−052) or (Task 71−00−00−760−057).

(1) Attach two PWA 85086 Arms to each eye on ends of arbor. Install hoist on each arm and raise rotor from the stand.

(2) Lower assembly onto balance machine. Secure arbor to machine. Remove hoist, arms and eyes from arbor. Attach arbor to balance machine with either belt drive or end drive.

(3) Install PWA 85174 Shroud to balance machine base.

(4) Operate the dynamic balance machine.

(a) Find the dynamic unbalance of the compressor hub and drum rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(5) Remove the arbor and the compressor hub and drum rotor assembly from the balance machine and turn the arbor on the rotor assembly 180 degrees from the original location as follows.

(a) Remove the belt drive or the end drive from the arbor assembly.

(b) Attach a hoist and PWA 85086 Lifting Arm to each eye of the balance arbor and lift the rotor assembly from the balance machine.

(c) Turn the assembly to a vertical position and remove the lower hoist and lifting arm. Lower the assembly to the build stand.

(d) Make a reference mark on the hub of the drum rotor, the shaft of the arbor and the spline with a Marker P05−045 to identify the original location.

(e) Remove the arbor from the rotor assembly. Refer to Assembly−09 (Task 72−31−01−440−009).

(f) Turn the arbor 180 degrees from the original location and lower the arbor to the rotor assembly.

(g) Attach the arbor to the rotor assembly. Refer to Assembly−05 (Task 72−31−01−440−005).

(h) Attach a hoist and PWA 85086 Lifting Arm to the upper eye of the balance arbor. Lift the rotor and arbor assembly from the build stand.

(i) Attach a hoist and PWA 85086 Lifting Arm to the lower eye of the balance arbor. Trunnion the assembly to a horizontal position.

(j) Lower the assembly to the balance machine. Attach the arbor to the balance machine with either a belt drive or end drive.

(6) Operate the dynamic balance machine.

(a) Find the dynamic unbalance of the compressor hub and drum rotor assembly while the assembly turns at 900 rpm minimum.

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(7) If the initial unbalance in the front plane (Plane J) is more than 25.0 oz−in. (18000.0 g.mm) in the front plane, check that all blades are in moment weighted pairs separated 180 degrees then interchange fan blade sets to reduce the unbalance to less than 25.0 oz−in. (18000.0 g.mm) as follows.

(a) Remove blade lock using small pin punch in hole located near joint or PWA 102828 Mechanical Compressor.

(b) Turn rotor to locate blade to be removed at 12 o'clock position.

(c) Unseat CCW blades until stopped by mid−span shroud of each blade. Remove selected blade. Seat blades using CW sequence.

(d) Turn rotor 180 degrees and remove second blade as stated in above instructions.

(e) Install first blade of replacement blade set. Seat blades partially using CW sequence.

(f) Turn rotor 180 degrees. Unseat blades until stopped by mid−span shroud of each adjacent blade.

(g) Install second blade of replacement set. Seat blades using CW sequence.

(h) Install blade lock assembly.

(8) Check the balance again. The rotor assembly must be balanced within 5.0 oz−in. (3600.0 g.mm).

(9) Record the angle and the amount of assembly unbalance in the front plane.

(10) Optional process based on the experience of the operator, do a check of the dynamic balance machine as follows:

(a) Install the PWA 85172 or PWA 85587 Calibration Weight (Check Weight) to Plane J (compressor hub front flange) as close as possible to the heavy angle.

NOTE: Do not install a check weight at a location where a counterweight is installed.

(b) Turn the dynamic balance machine at 900 rpm minimum. Check the machine, with the check weight installed in the front plane.

1 The check weight on the front plane pulls 4.0 oz−in. (2880.0 g.mm).

2 Read the angle and the amount of assembly unbalance in the front plane.

3 The amount of unbalance in the front plane should agree in ± 0.4 oz−in. (288.0 g.mm) or less with the amount recorded when the assembly was balanced.

4 Remove the check weight from the front plane.

(c) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the dynamic balance machine.

(11) Disconnect arbor from balance machine. Install eye to each end of arbor. Attach two PWA 85086 Arms to eyes. Install hoist to each arm and raise rotor from balance machine.

(12) Lower rotor onto either PWA 87111 or PWA 85184 Stand. Secure rotor to stand. Remove hoist and arms.

D. Postrequisites

(1) Remove fan blades and arbor. See Assembly-09 Task 72-31-01-440-009.

Task 72-31-01-440-008-B:

2. Balance LPC Rotor (Fan Blades Included) By Counterweight Installation

A. Prerequisites

(1) Balance the LPC rotor without the fan blades installed. See Assembly-06 Task 72-31-01-440-006.

(2) Assemble fan blades to hub. See Assembly-07 Task 72-31-01-440-007.

B. Equipment And Materials Necessary

Special Tools:

PWA 28375	Riveter
PWA 85086	Lift Arm (2 Necessary)
PWA 85172	Weight, Calibration (Check Weight) (Optional to PWA 85587)
PWA 85173	Weight, Calibration (Check Weight) (Optional to PWA 85588)
PWA 85174	Shroud
PWA 85184	Stand (Optional to PWA 87111)
PWA 85587	Weight, Calibration (Check Weight)
PWA 85588	Weight, Calibration (Check Weight)
PWA 87111	Stand, Installation

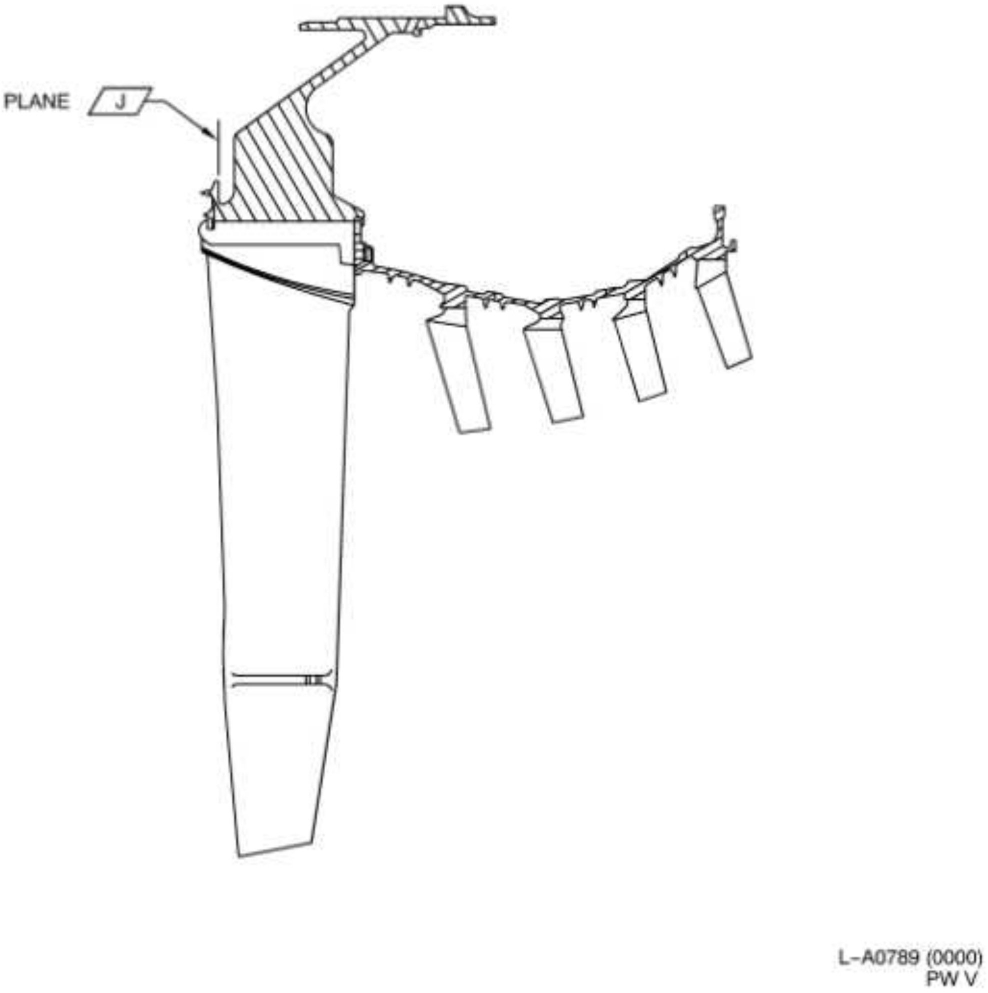
C. Procedure
Figure 1002

(1) Attach two PWA 85086 Arms to each eye on the ends of arbor. Install a hoist on each arm and raise the rotor from the stand.

(2) Lower the assembly to the balance machine. Attach the arbor to the machine. Remove the hoist, arms and eyes from the arbor. Attach the arbor to the balance machine with the belt drive or the end drive.

(3) Install the PWA 85174 Shroud to the balance machine base.

(4) Operate the dynamic balance machine.



LPC Balancing (Fan Blades Included)
Figure 1001
(Task 72-31-01-440-008-A)

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−08

(a) Find the dynamic unbalance of the compressor hub and drum rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(5) Remove the rotor assembly from the balance machine. Lower the rotor onto the PWA 87111 Stand.

(6) Remove the fan blades from the compressor hub. See Assembly−09 (Task 72−31−01−440−009).

(7) Install the fan blades in the compressor hub 180 degrees from the original location, retaining the original order and direction. See Assembly−07 (Task 72−31−01−440−007).

(8) Attach a hoist and PWA 85086 Lifting Arm to each eye of the balance arbor and lift the rotor assembly from the stand.

(9) Lower the assembly to the balance machine. Attach the arbor to the balance machine with either a belt drive or end drive.

(10) Force moment balance the rotor at 900 rpm minimum. Record the results, amount and angle.

(a) Make a polar plot of both runs to find the quantity and direction of the unbalance added by the compressor hub and drum rotor assembly and the fan blade set.

(b) If the unbalance of the compressor hub and drum rotor assembly is more than 2.0 oz−in. (1440.0 g.mm), add PN 534493 and PN 534495 counterweights at Plane F to correct the unbalance to under 2.0 oz−in. (1440.0 g.mm). Before you attach the counterweights, mark the forward face of the counterweight with the word HUB.

NOTE: If the fan blade unbalance is more than 25.0 oz−in. (18000.0 g.mm), it is an indication that the fan blades were installed incorrectly.

(c) Check that all the fan blades are in moment weighted pairs, separated 180 degrees apart.

(d) Change fan blade pair positions to get an unbalance of less than 25.0 oz-in. (18000.0 g.mm).

(e) Add PN 534493 and PN 534494 counterweights at Plane F to correct the fan unbalance. Before you attach the counterweights, mark the word FAN on the forward face of the counterweights.

(f) Residual unbalance must not be more than 5.0 oz-in. (3600.0 g.mm).

(g) If the fan blades must be replaced at a later time, only the counterweights with the word FAN on the forward surface must be removed if there is an unbalance correction necessary.

NOTE: The counterweights with the mark HUB on the forward surface must remain with the same serial numbered hub unless that hub gets refurbished, at which time they would be removed.

(h) The total quantity of all balance weights attached to Plane J from Assembly-06 (Task 72-31-01-440-006) and this procedure is limited to a maximum of 10, with a maximum of five PN 534493 counterweights and five PN 534495 counterweights.

(11) Force moment balance the rotor at 900 rpm minimum. Record the results, amount and angle.

(12) If the unbalance is equal to or less than 15.0 oz-in. (10800.0 g.mm) do the steps that follow.

(a) Add PN 534493 and PN 534495 weights to correct the unbalance as necessary at Plane J.

(b) Make sure the residual unbalance is not more than 5.0 oz-in. (3600.0 g.mm).

(13) Attach the counterweights in Plane F and Plane E with the installed rivets as follows.

(a) Flare the rivets on Plane F (compressor hub front flange) with the PWA 28375 Hand Riveter to 0.125 inch (3.175 mm) diameter minimum.

(b) Flare the rivets on Plane E (drum rotor rear flange) with the PWA 28375 Hand Riveter to 0.125 inch (3.175 mm) diameter minimum.

(14) Disconnect the arbor from the balance machine. Install the eye to each end of the arbor. Attach two PWA 85086 Arms to the eyes. Install a hoist to each arm and raise the rotor from the balance machine.

(15) Lower the rotor to the PWA 87111 Stand or PWA 85184 Stand. Attach the rotor to the stand. Remove the hoist and arms.

D. Postrequisites

(1) Remove fan blades and arbor. See Assembly−09 Task 72−31−01−440−009.

LPC Balancing (Fan Blades Included)
Figure 1002
(Task 72-31-01-440-008-B)

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-09

Task 72-31-01-440-009:

1. Remove Fan Blades And Arbor
   - A. Prerequisites
     - (1) Balance LPC Rotor (Fan Blades Included). See Assembly-08 (Task 72-31-01-440-008).
   - B. Equipment And Materials Required

Special Tools:
PWA 85086 Arm (2 Required)

PWA 85660 Build/Storage Stand (Optional to PWA 88183)
PWA 86651 Cart, Storage
PWA 88183 Stand

   - C. Procedure
     - (1) Number blades 1 - 38 using CW sequence (viewed from front). Mark several corresponding hub slots.
     - (2) Remove blade lock assembly using small pin punch in hole located near joint.
     - (3) Turn rotor to locate No. 38 at 12 o'clock position.
     - (4) Unseat blades until stopped by mid-span shroud of each adjacent blade.
     - (5) Remove No. 38, 37, 36, etc. blades and store blades in PWA 86651 Cart.
     - (6) Install PWA 85086 Arm to each eye on arbor. Attach hoist to arms and raise rotor from stand.
     - (7) Trunnion rotor to hub end up. Remove hoist and arm from lower end. Lower rotor down onto PWA 88183 or PWA 85660 Build Stand.
     - (8) Loosen nut on arbor using standard tooling. Remove arbor nut. Release hydraulic pressure on arbor and raise arbor out of rotor. Place arbor in storage box.
     - (9) Cover rotor assembly with protective covering.

NO. 1 BEARING (CARBON) SEAL ASSEMBLY − DISASSEMBLY−01

Task 72−31−17−040−001:

1. Disassemble No. 1 Bearing (Carbon) Seal Assembly

   A. Equipment And Materials Required − None

   B. Procedure

      (1) Depress seal face assembly against springs.

      (2) Remove cotter pins, collars and washers. Separate seal face assembly from seal ring holder assembly.

      (3) Remove sleeve spacers and springs.

      (4) Remove seal ring from seal ring holder assembly.

      (5) Remove nuts retaining pins to support. Remove packing and discard.

NO. 1 BEARING (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

Task 72-31-17-440-001:

1. Assemble No. 1 Bearing (Carbon) Seal Assembly

A. Equipment And Materials Required

Special Tools:

PWA 86514	Guide, Assembly

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	4	72-31-00/7/150
Packing	4	72-31-00/7/50
Seal Ring*	1	72-31-00/7/100A
Seal Ring*	1	72-31-00/7/100B

R NOTE: * These seal rings are for seal assembly part numbers other than PN 50B199. PN 50B199 uses a piston ring. Piston rings are not expendable items.

B. Procedure
See Figure 1001, Figure 1002 and Figure 1003.

(1) Install support assembly on bench large OD down.

(2) Install new packing, lubricated with Engine Oil P03-001, to each of 4 pins at the threaded end and seat against pin shoulder.

(3) Install pins to support assembly so that the threaded portion of pin is up and exposed. Install nuts and washers, threads lubricated with Engine Oil P03-001, to pins. Torque nuts 75 - 85 lb-in. (8.474 - 9.604 N.m).

NOTE: Attach pins so that cotter pin hole is positioned 90 degrees from radial axis of support assembly.

CAUTION: CARBON SEAL IS EASILY DAMAGED. HANDLE WITH CARE.

(4) Carefully install seal/piston ring in groove of seal assembly.

NOTE: When you handle and install the seal ring you must be careful not to pinch or damage the seal ring.

(a) (PN 50B199) Be sure gap in piston ring is installed as shown in Figure 1002.

(5) Put the support assembly on PWA 86514 Guide.

(6) Turn support assembly so that pins are facing upward on bench. Install 12 springs into support assembly. Install two sleeve spacers on two pins which are located 90 degree from offset pin.

NOTE: Damage to springs will occur if springs buckle, bend or are compressed to their solid height during installation. Damaged springs reduce spring load and could effect carbon seal integrity.

NOTE: If you have much wear on the flat sides of the sleeve spacers, you can install the sleeve spacers with the wear towards the support. See Figure 1002.

(7) Carefully install face seal, carbon side up, aligning slots in seal with pins on support. Install collars and secure with cotter pins. Bend tangs of pins around collars.

NOTE: Be careful not to pinch or damage the seal ring when you install the face seal into the support assembly. See Figure 1002.

(8) Put the tool away.

C. Postrequisites

(1) Airflow check No. 1 bearing (carbon) seal assembly per 72-31-17, Testing-01 Task 72-31-17-720-001.

NO. 1 BEARING (CARBON) SEAL ASSEMBLY - TESTING-01

Task 72-31-17-720-001:

1. Airflow Check No. 1 Bearing (Carbon) Seal Assembly

A. Prerequisites

(1) Assemble No. 1 bearing (carbon) seal assembly by Assembly-01 (Task 72-31-17-440-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 6507	Flowmeter, Leak Test
PWA 45411	Gage, Differential Pressure
PWA 46400	Gage, Measurement
PWA 85036	Fixture, Leak Test

C. Procedure
See Figure 1301.

(1) Remove cover from PWA 85036 Fixture and inspect packings and neoprene sealing surfaces.

(2) Remove detail seal ring and inspect micro-finish surface for nicks and scratches.

(3) Reinstall seal ring with micro-finish surface up and secure.

(4) Carefully lower seal assembly into fixture to seat on fixture seal ring face and base.

(5) Install detail plate over seal assembly outside diameter and secure.

(6) Using lifting handles, install cover in fixture locating on top surface of seal assembly. Secure cover.

(7) For operators who use PWA 6507 Flowmeter and PWA 45411 Gage, connect the flowmeter and gage to the fixture:

(a) Connect hose from PWA 6507 Flowmeter to larger of two quick-diconnect fittings (marked FLOWMETER) attached to fixture face.

(b) Attach smaller fitting of PWA 45411 Gage to the remaining fitting on fixture base.

(c) Attach air inlet hose to fitting marked INLET on cover.

(d) Attach the larger quick−disconnect fitting on the gage to the remaining quick−disconnect fitting on the fixture cover.

(8) For operators who use PWA 46400 Gage, connect the gage to the fixture:

(a) Install the gage hose marked RETURN on the fixture fitting marked FLOWMETER, on the base of the fixture.

(b) Install the gage hose marked D.P. LOW on the remaining fitting on the fixture base.

(c) Install the gage hose marked SUPPLY on the fitting marked INLET, on the fixture cover.

(d) Install the gage hose marked D.P. HIGH on the remaining quick−disconnect fitting on the cover.

(9) Do the check for total air leakage:

(a) Supply regulated, filtered air to the fixture to 40 psi (275.8 kPa) and permit it to stabilize for five minutes.

(b) For PN 50B199, leakage must not be greater than 2.5 cfm (0.07 cmm).

(c) For PNs 50B247, 50B275, 50B772 and 51B170, leakage must not be greater than 0.5 cfm (0.01 cmm).

(10) If the seal assembly is not inside limits, it is necessary to do a check of the leakage at the piston/seal ring:

(a) Remove the fixture cover.

(b) Remove the seal assembly.

(c) Remove the detail seal ring.

(d) Install the detail seal ring in the fixture, rubber side up.

(e) Install the seal assembly and the cover.

(f) Do another air flow check. This value is the leakage at the piston/seal ring.

1 Subtract this value from the total leakage value. The result is the leakage at the carbon element.

D. Postrequisites

(1) If there is leakage at the carbon element, lap the carbon element. Refer to the PW4000 Series CIR, PN 51A357, 72-31-18, Repair-06.

(2) If the leakage is not within limits and not at the carbon element, replace the piston/seal ring. Refer to Disassembly-01 (Task 72-31-17-040-001) and Assembly-01 (Task 72-31-17-440-001).

COMPRESSOR INLET CONE (REAR) SEGMENT ASSEMBLY - ASSEMBLY-01

Task 72-31-81-440-001:

1. Balance Compressor Inlet Cone (Rear) Segment Assembly

A. Equipment And Materials

Special Tools:

PWA 25704	Housing, Balance (Use With PWA 29231)
PWA 29231	Arbor, Balance (Optional To PWA 86547)
PWA 8170-27	Housing, Balance (Use With PWA 29231)
PWA 86115	Adapter, Arbor (For Inlet Cone Segments With A Maximum Diameter of 27.384 Inch (695.554 mm)
PWA 86116	Weight, Calibration (For Balance Machines Without Electronic Calibration)
PWA 86117	Weight, Calibration (For Balance Machines Without Electronic Calibration)
PWA 86118	Fixture
PWA 86403	Arbor, Balance (Optional To PWA 86547)
PWA 86547	Arbor, Balance
PWA 86599	Adapter, Arbor (For Inlet Cone Segments With A Maximum Diameter of 27.410 Inch (696.214 mm)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-150	Fiberglass Cloth (AMS 3824, Style 7781)
P08-039	Resin,(Hysol EA 9396 Part A)
P08-039	Resin,(Hysol EA 9396 Part B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	0-12	72-31-00/1/130

B. Procedure
See Figure 1001, Figure 1002, Figure 1003 and Figure 1004.

NOTE: This balance procedure is necessary if it is specified in any repair procedure done on the inlet cone.

COMPRESSOR INLET CONE (REAR) SEGMENT ASSEMBLY − ASSEMBLY−01

(1) Install PWA 86599 or PWA 86115 Adapter on PWA 86547 Arbor, PWA 86403 Arbor or PWA 29231 Arbor.

NOTE: Arbor and adapter must be balanced before installation of inlet cone.

NOTE: Use PWA 86115 Adapter only on inlet cone segments with a maximum part diameter of 27.384 Inch (695.554 mm). Use PWA 86599 Adapter only on inlet cone segments with a maximum part diameter of 27.410 Inch (696.214 mm).

(2) Install inlet cone rear segment, front end down, in PWA 86118 Fixture. See Figure 1001.

NOTE: Make sure old counterweights have been removed from inlet cone.

(3) Install arbor and adapter to inlet cone with 19 cap screws and washers lubricated with Engine Oil P03−001. Torque screws to 65 − 70 lb−in. (7.344 − 7.909 N.m).

(4) (For operators who use PWA 29231 Arbor) Install PWA 8170−27 Housing to cradle supports of balance machine and attach PWA 25704 Housing to PWA 8170−27 Housing. See Figure 1002.

(5) (For operators who use Post PWA 29231 Arbors) Install balance machine rollers in the balance machine. Refer to Figure 1002.

NOTE: The balance machine rollers are not shown in the referenced figure.

(6) With hoist, lift arbor assembly and inlet cone rear segment from fixture. With additional hoist, trunnion assembly to horizontal position. Place arbor and inlet cone onto balance machine removing detail lifting eyes.

(7) Make a reference line on balance arbor and inlet cone rear segment.

(8) Attach PWA 86116 Calibration Weight to one of the 0.112 − 0.116 inch (2.845 − 2.946 mm) diameter counterweight holes on the 11.998 inch (304.749 mm) diameter bolt circle.

(9) Attach PWA 86117 Calibration Weight to one of the 0.208 − 0.223 inch (5.28 − 5.66 mm) diameter counterweight holes on the 28.080 inch (713.232 mm) diameter bolt circle.

(10) Start balance machine and calibrate meter on machine to 1.0 oz−in. (720.0 g.mm).

(a) For balance machines without electronic calibration, do a check of the static balance machine. After you calibrate the balance machine, remove the calibration weights.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(11) Run the machine at 600 RPM minimum (900 RPM maximum allowed) to find initial unbalance. Initial unbalance should not be greater than 36.0 oz−in. (25920.0 g.mm) in Plane C and 12.0 oz.in. (8640.0 g.mm) in Plane AC.

(12) Run the machine at 600 RPM minimum (900 RPM maximum allowed) to find the dynamic unbalance. The dynamic unbalance of the inlet cone segment in Plane C and Plane AC must not be more than 1.0 oz−in. (720.0 g.mm).

(13) Correct the unbalance by adding counterweights. See Figure 1003.

(a) Correct unbalance In Plane C as follows:

1 Apply Engine Oil P03−001 to the threads of the screws you will use in the following step.

2 Use PN ST2194−030 screw, PN 776440 nut and PN 696853 washers. Use at least one washer for each screw but no more than four at each location.

3 Torque the screw(s) by measuring the torque necessary to turn the screw through the lock feature of the nut. Add this torque to 22 − 40 lb−in. (2.486 − 4.519 N.m) for the total torque.

4 Remove any excess lubricant.

R (b) Correct unbalance in Plane AC as follows:

R 1 Use PN 534493, PN 534495 or PN 534492 counterweight in any combination at nine holes maximum within ± 60° of unbalance vector. You can also add a maximum of two PN 534492 counterweights at any angular location.

R 2 Use the PWA 85234 Hand Riveter to flare counterweight PN 534492 and rivet PN 534494 to
R 0.125 inch (3.175 mm) minimum diameter. Refer
R to Section 70−43, Standard Practices Manual, PN
R 585005.

R (c) Check balance again on machine to make sure assembly is within specified limits.

(14) If dynamic unbalance continues after counterweight(s) are added, further correction may be made with the use of bonded fiberglass cloth as follows: See Figure 1004.

NOTE: The fiberglass cloth counterweight is to be of 3 layers (plies), an axial width (W) of 2.00 inches (50.80 mm) and an appropriate circumferential length (L) to correct the approximate amount of unbalance as specified in Table 1001.

OZ−IN. (g.mm)	# Plies	Axial Width (W), Inches (mm)	Circ. Length (L), Inches (mm)
1.00 (720)	3	2.00 (50.80)	2.00 (50.80)
2.00 (1440)	3	2.00 (50.80)	3.00 (76.20)
3.00 (2160)	3	2.00 (50.80)	4.00 (101.60)
4.00 (2880)	3	2.00 (50.80)	5.00 (127.00)
5.00 (3600)	3	2.00 (50.80)	6.00 (152.40)

Fiberglass Cloth Counterweight
Table 1001

(a) After you determine the proper location for the fiberglass counterweight, locally hand sand the location with 120/150 grit the inside wall of the "Y" flange and clean by the SPOP 208. See 70−21−00, Standard Practices Manual, PN 585005.

CAUTION: TO MAKE SURE YOU HAVE BOND INTEGRITY, THE FIBERGLASS COUNTERWEIGHT MUST BE APPLIED IN A CLEAN ROOM, PRESSURIZED ABOVE ATMOSPHERIC PRESSURE, FREE OF CONTAMINANTS, AND AT CONTROLLED CONSTANT TEMPERATURE OF 75 DEGREES +/− 10 DEGREES F (23.4 DEGREES +/− 5.5 DEGREES C)

(b) Apply a patch with 68 − 73 percent Fiberglass Cloth P05−150 and 27 − 32 percent resin mixture by weight. Resin mixture to be 100 parts of Resin P08−039, Part A and 30 parts of Resin P08−039, Part B by weight. Follow the resin manufacturer's instructions.

(c) Successive layers can be reduced in size as appropriate.

(d) Allow the bond to set at room temperature for 24 hours followed by 150 degree F +/− 10 degrees for 1 hour cure time.

(e) Check the unbalance on the balance machine for compiance with step (13) limits.

(15) Remove arbor assembly and inlet cone rear segment from the balance machine and install in PWA 86118 Fixture, front end down.

(16) Remove the 19 cap screws and washers which hold the inlet cone rear segment to the arbor. Remove arbor assembly.

(17) Remove inlet cone rear segment from fixture.

STAGE 1 LPC BLADE ASSEMBLY - ASSEMBLY-01

Task 72-31-82-440-001:

1. Balance Complete Stage 1 LPC Blade (Fan Blade Set) Assemblies

A. Equipment And Materials Necessary

Special Tools:

PWA 85086	Lift Arm (2 Necessary)
PWA 85174	Shroud
PWA 85660	Stand (Optional to PWA 88183)
PWA 85684	Arbor (Optional to PWA 85695)
PWA 85695	Arbor (Optional to PWA 87037)
PWA 85804	Ring, Retaining
PWA 85847	Adapter, Build Stand
PWA 86651	Cart, Storage
PWA 87037	Arbor
PWA 87135	Adapter
PWA 88183	Stand, Build/Storage

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil (PWA 521B)
P06-005	Lubricant (PWA 587)

B. Procedure

See Figure 1001 and Figure 1002.

(1) Remove a blade set (pair) from PWA 86651 Cart and place on bench to form the beginning of two columns.

NOTE: A matched set of blades consists of two blades with the same moment weight oz-in. value or as close as possible within 1.0 oz-in. (720 g.mm). The oz-in. (g.mm) value is marked on concave side of airfoil just inboard of mid-span shroud.

(2) Remove remaining blade sets from container and place one blade from each set into each column.

(3) Rearrange blades in both columns in ascending order (light to heavy) moving blades in sets. When blades are assembled into hub, blades of the same set must be 180 degrees apart.

(4) Identify blades in column one, 1 through 19 and 20 through 38 in column two, on convex side of airfoil.

STAGE 1 LPC BLADE ASSEMBLY − ASSEMBLY−01

(5) Visually check the exterior of the blades for security of details, absence of damage and absence of foreign material. Particular attention should be directed to the mating surfaces.

(6) Obtain bill of material from compressor hub and secure PWA 85804 Retaining Ring onto rear face of hub as follows:

(a) Place special washers onto shoulder bolts.

(b) Insert shoulder bolts into front face of hub and into the retaining ring.

(c) Place the remaining special washers on the shoulder bolts and secure with nuts.

(7) Install PWA 85847 Adapter on PWA 88183 or PWA 85660 Stand.

(8) Secure hub/retaining ring onto PWA 85847 Adapter.

(9) Install the balance arbor to the LPC hub assembly.

NOTE: The hub assembly is in the front end up position.

(a) For PWA 85684 or PWA 85695 Balance Arbors.

1 Attach a hoist to the eye on the arbor. Lift the arbor over the hub assembly and carefully

2 Attach the hub to the balance arbor using detail retaining nut lubricated with Engine Oil P03−001, and hydraulic actuation screw. Torque nut to 800 − 1200 lb−in. (90.388 − 135.582 N.m) with two standard one−half inch square drive torque wrenches.

(b) For PWA 87037 Balance Arbor.

1 Install PWA 87135 Adapter to the hub assembly. Attach the adapter to the front face of the hub.

2 Lift PWA 87135 Adapter with the hub assembly and install the assembly to PWA 87037 Arbor .

3 Remove PWA 87135 Adapter from the hub assembly.

4 Attach the hub to the balance arbor using detail retaining nut lubricated with Engine Oil P03−001, and hydraulic actuation screw. Torque nut to 800 − 1200 lb−in. (90.388 − 135.582 N.m) with detail adapter wrench and a standard one−half inch square drive torque wrench.

(10) Raise arbor and hub from build stand. Attach PWA 85086 Lift Arms on eyes at each end of arbor. Wit a hoist, trunnion assembly to horizontal position.

(11) Lower arbor and hub assembly onto balance machine. Remove lifting equipment and attach arbor to balance machine.

(12) Install PWA 85174 Shroud to balance machine.

(13) Balance hub assembly.

(14) Install blades in hub as follows:

WARNING: AVOID CONTACT OF LUBRICANT P06−005, WITH SKIN. IF CONTACT OCCURS, WASH IMMEDIATELY WITH SOAP AND WATER.

(a) Brush Lubricant P06−005 on contact faces of mid−span shroud of blades and permit to dry five minutes.

(b) Install number one blade into hub blade slot located at six o'clock position and identified as number one on hub nut flange. See Figure 1003. Engage blade root approximately one quarter of the way into blade slot. Using same procedure, install remaining blades in sequence in a clockwise (CW) direction until all blades are installed.

(c) Tap blades evenly in a CW direction as viewed from the front until all 38 blades are seated.

NOTE: Blades may be seated only when all blades are installed.

(d) Install blade lock assembly starting with left half of split, positioning lock to align anti−rotation pin of lock with anit−rotation slot of hub. Tap lock lightly to seat using fiber drift.

STAGE 1 LPC BLADE ASSEMBLY − ASSEMBLY−01

(15) Balance hub and blade assembly to within 10 oz−in. (7200 g.mm) at 900 rpm. Blade sets may be repositioned to correct unbalance.

(16) Reposition blade sets as follows:

(a) Remove blade lock using small pin punch in hole located near joint.

(b) Turn assembly to locate blade to be removed at 12 o'clock position.

(c) Unseat counterclockwise (CCW) blades until stopped by mid−span shroud of each blade.

(d) Remove selected blade. Seat blades partially CW sequence.

(e) Turn assembly 180 degrees and remove second blade per above instructions.

(f) Remove other blade set(s) selected for repositioning per above instructions.

(g) Install first blade of repositioning blade set. Seat blades partially using CW sequence.

(h) Turn assembly 180 degrees. Unseat blades until stopped by mid−span shroud of each adjacent blade.

(i) Install second blade of repositioned set. Seat blades partially using CW sequence. Continue procedure until all blade sets selected for repositioning are installed in hub. Seat blades using CW sequence.

NOTE: Blades of a set must be positioned 180 degrees apart.

(j) Install blade lock assembly.

(17) Check balance to limits specified above.

(18) Once blades are balanced, record amount and angle of residual "FORCE" unbalance.

(19) Record amount and angle of residual "MOMENT" unbalance.

STAGE 1 LPC BLADE ASSEMBLY − ASSEMBLY−01

(20) Reidentify blades 1 through 38 on convex side of airfoil in sequence.

(21) Transfer the balanced set of fan blades to the engine hub or storage cart.

(22) Remove arbor and hub from balance machine.

LPC/LPT COUPLING - HOW TO USE MANUAL

Task 72-32-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant LPC/LPT Coupling parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

LPC/LPT COUPLING − DESCRIPTION AND OPERATION

Task 72−32−00−990−002:

1. LPC/LPT Coupling

See Figure 1.

A. General

(1) The low pressure compressor (LPC) rotor is driven by the low pressure turbine (LPT). The LPC/LPT coupling consists of those interface parts that attach and secure the front compressor hub of the LPC rotor to the front compressor drive turbine (LPT) shaft.

(2) The main feature of the LPC/LPT coupling is a titanium turbine shaft coupling which at the front is splined to the front compressor hub and at the rear is splined to the LPT shaft. A steel retaining nut secures the front compressor hub to the turbine shaft coupling while a titanium retaining nut secures the coupling to the LPT shaft. The turbine shaft coupling is supported structurally through the No. 1.5 roller bearing to the intermediate case.

(3) Mounted on the turbine shaft coupling is a steel motional pickup wheel from which the low rotor speed (N1) is determined.

LPC/LPT COUPLING - DISASSEMBLY-01

Task 72-32-00-030-001-001:

1. Disassemble LPC/LPT Coupling (Mechanical Wrench)
   A. Equipment And Materials Required

      Special Tools:
      PWA 3755 Hydraulic Pump (Optional to PWA 29389)
      PWA 29389 Hydraulic Pump
      PWA 45418 Wrench, Mechanical*
      PWA 45419 Multiplier, Pneumatic*
      PWA 76154 Adapter
      PWA 80071 Multiplier, Torque*
      PWA 80187 Wrench, Mechanical*
      PWA 80651 Multiplier, Pneumatic*
      PWA 85261 Adapter
      PWA 85264 Adapter, Holding*
      PWA 85265 Wrench, Torque*
      PWA 85375 Plate, Anchor*
      PWA 85266 Puller
      PWA 85468 Stand
      PWA 88100 Plate, Anchor*

      *Refer to Table 501 for tool options. Only Table 501 shows the correct combinations of tools for the removal of the No. 1.5 bearing (inner race) retaining nut.

   B. Procedure
      See Figure 501.

Subtask 72-32-00-030-051:

(1) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapter to an appropriate two cable sling to lift and/or trunnion coupling. Install coupling in PWA 85468 Stand, bearing end up.

(2) Remove retaining ring securing key washer between coupling and nut. Remove key washer.

(3) Install PWA 85264 Adapter into coupling aligning splines. Install PWA 85265 Wrench on coupling aligning slots in wrench with slots in retaining nut. Install a torque multiplier or mechanical wrench on the torque wrench. Install an anchor plate and, if you want, a pneumatic multiplier on the mechanical wrench. Refer to Table 501. Loosen and remove nut securing seal seat and No. 1.5 bearing to coupling.

(4) Remove seal seat from coupling. Place seal seat in protective container.

(5) Install PWA 85266 Puller to No. 1.5 bearing. Using PWA 3755 or PWA 29389 Hydraulic Pump remove bearing from coupling.

NOTE: Use gloves when handling bearing. See Standard Practices Manual.

(6) Install bearing in protective container.

LPC/LPT COUPLING - DISASSEMBLY-02

Task 72-32-00-030-001-002:

1. Disassemble LPC/LPT Coupling (Hydraulic Wrench)

A. Equipment And Materials Required

Special Tools:

PWA 3755	Pump, Hydraulic (Optional to PWA 29389)
PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump*
PWA 28815	Cart*

PWA 85264	Adapter, Holding*
PWA 85265	Wrench, Torque*
PWA 85266	Puller
PWA 85468	Stand
PWA 85516	Wrench, Torque
PWA 85517	Adapter, Holding
PWA 87354	Wrench, Hydraulic*
PWA 88100	Plate, Anchor*

*Refer to Table 501 for tool options. Only Table 501 shows the correct combinations of tools for the removal of the No. 1.5 bearing (inner race) retaining nut.

B. Procedure
See Figure 501.

Subtask 72-32-00-030-052:

(1) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapter to an appropriate two cable sling to lift and/or trunnion coupling. Install coupling in PWA 85468 Stand, bearing end up.

(2) Remove retaining ring securing key washer between coupling and nut. Remove key washer.

(3) Install a holding adapter into coupling aligning splines. Install a torque wrench on coupling aligning slots in wrench with slots in retaining nut. Install a hydraulic wrench on the torque wrench. If applicable, install the anchor plate on the hydraulic wrench. Loosen and remove nut securing seal seat and No. 1.5 bearing to coupling.

(4) Remove seal seat from coupling. Place seal seat in protective container.

(5) Install PWA 85266 Puller to No. 1.5 bearing. Using PWA 3755 or PWA 29389 Hydraulic Pump remove bearing from coupling.

NOTE: Use gloves when handling bearing. See Standard Practices Manual.

(6) Install bearing in protective container.

Previous Pageblock Return to Previous Menu Next Pageblock

LPC/LPT COUPLING - INSPECTION/CHECK-01

Task 72-32-00-990-004:

1. General Inspection Requirements - LPC/LPT Coupling

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check-00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

   - (c) Magnetic Particle Method
   - (d) X−ray Method
   - (e) Ultrasonic Method
   - (f) Hardness Check
   - (g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

   - (a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

     NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

   - (b) Allowable blending for visual damage, which may be accomplished within the inspection area.

     NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

   - (a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

   - (a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

   - (a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

LPC/LPT COUPLING − INSPECTION/CHECK−01

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−32−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−32−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

LPC/LPT COUPLING − INSPECTION/CHECK−01

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

   (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

   (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

LPC/LPT COUPLING - INSPECTION/CHECK-03

Task 72-32-00-990-005:

1. Visual Inspection - LPC/LPT Coupling
   A. For inspection requirements applicable to installed (accessible) parts of LPC/LPT coupling see 72-00-32, Inspection/Check-XX (Task 72-00-32-XXX-XXX).

Previous Pageblock Return to Previous Menu Next Pageblock

LPC/LPT COUPLING - INSPECTION/CHECK-04

Task 72-32-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

LPC/LPT COUPLING − INSPECTION/CHECK−04

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurement taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(-)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(-)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

LPC/LPT COUPLING - ASSEMBLY-01

Task 72-32-00-400-001-001:

1. Assemble LPC/LPT Coupling (Mechanical Wrench)

A. Prerequisites

(1) See 72-32-00, Inspection/Check-04 Task 72-32-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 45418	Wrench, Mechanical*
PWA 45419	Multiplier, Pneumatic*
PWA 76154	Adapter
PWA 80071	Multiplier, Torque*
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic*
PWA 85261	Adapter
PWA 85262	Guide, Piloting
PWA 85263	Drift
PWA 85264	Adapter, Holding*
PWA 85265	Wrench, Torque*
PWA 85375	Plate, Anchor*
PWA 85468	Stand
PWA 88100	Plate, Anchor*

NOTE: *Refer to Table 1001 for tool options. Only Table 1001 shows the correct combinations of tools for the installation of the No. 1.5 bearing (inner race) retaining nut.

C. Procedure
See Figure 1001.

Subtask 72-32-00-430-051:

(1) Heat the No. 1.5 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

(2) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapters to appropriate 2 cable sling to lift and/or trunnion coupling. Position coupling on PWA 85468 Stand front end down. Install PWA 85262 Guide into end of coupling.

LPC/LPT COUPLING − ASSEMBLY−01

(3) Following assembly procedure should be accomplished as rapidly as possible.

  (a) Using proper gloves, position the heated No. 1.5 bearing on the coupling (mating mark up).

  (b) Install PWA 85263 Drift to pilot on rod of guide on coupling. Drift bearing to seat on coupling.

  (c) Leave the drift on the bearing until it cools to 75° − 85°F (23.9° − 29.4°C).

  (d) Remove drift from coupling.

  (e) Make sure the inner race of the bearing has cooled to 75° − 85°F (23.9° − 29.4°C) before you continue with the assembly procedure.

(4) Install seal seat over coupling with "REAR" up and butt against bearing.

(5) Install retaining nut to secure bearing and seal seat. Refer to Table 1001 for the correct combinations of tools.

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Plate Holder or Anchor Plate
85265	85264	80187	80651 or 45419	88100 or 85375
85265	85264	45418	45419	88100 or 85375
85265	85264	80071	80651 or 45419	88100

Matrix Of Tools Used To Install The No. 1.5 Bearing (Inner Race) Retaining Nut
Table 1001

LPC/LPT COUPLING − ASSEMBLY−01

(6) Install PWA 85264 Adapter into coupling, aligning splines. Install PWA 85265 Torque Wrench on coupling, aligning slots in wrench with slots in retaining nut. Install a mechanical wrench on the torque wrench. Install an anchor plate on the mechanical wrench.

NOTE: Wrench may be actuated using a pneumatic multiplier.

(7) (Reference 972) Torque nut as follows:

(a) Tighten nut to 2200 − 2800 lb−in. (248.567 −
R 316.357 N.m). Turn nut through angle of 11 − 12
R degrees 12 minutes and loosen nut to zero.

(b) Tighten nut to 2200 − 2800 lb−in. (248.567 − 316.357 N.m).

(c) Establish common reference points between nut and its mating part.

R (d) Turn nut through angle of 11 − 12 degrees 12
R minutes.

(e) Loosen nut to zero and repeat step (b).

(f) If nut reference point is in line with mating part reference point or beyond it within 2 degrees maximum, apply final angle of turn per step (d).

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order until reference points are within limits. Then perform step (f).

(8) Remove tooling from coupling.

(9) Check, with a 0.001 inch (0.025 mm) feeler gage, that the seal seat and bearing are correctly seated on the coupling. The seal seat and bearing are correctly seated if you are unable to fit the 0.001 inch (0.025 mm) feeler gage between the coupling shoulder, bearing and seal seat.

(10) Install key washer to nut and coupling. Install retaining ring to secure key washer.

(11) Install protector around bearing and seal seat.

Task 72-32-00-400-001-002:

1. Assemble LPC/LPT Coupling (Hydraulic Wrench)

A. Prerequisites

(1) See 72-32-00, Inspection/Check-04 Task 72-32-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:

PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump*
PWA 28815	Cart*
PWA 29510	Pump*
PWA 33732	Wrench, Hydraulic*
PWA 75046	Cart*
PWA 76154	Adapter
PWA 80070	Wrench, Hydraulic*
PWA 85261	Adapter
PWA 85262	Guide
PWA 85263	Drift
PWA 85264	Adapter, Holding*
PWA 85265	Wrench, Torque*
PWA 85468	Stand
PWA 85516	Wrench
PWA 85517	Adapter
PWA 87354	Wrench, Hydraulic*
PWA 88100	Plate, Anchor*

NOTE: *Refer to Table 1001 for tool options. Only Table 1001 shows the correct combinations of tools for the installation of the No. 1.5 bearing (inner race) retaining nut.

C. Procedure
See Figure 1001.

Subtask 72-32-00-430-052:

(1) Heat the No. 1.5 bearing inner race and rollers. See Standard Practices Manual, PN 585005.

LPC/LPT COUPLING − ASSEMBLY−02

(2) Install PWA 85261 Adapter to coupling. Attach PWA 76154 Adapter to appropriate 2 cable sling to lift and/or trunnion coupling. Position coupling on PWA 85468 Stand front end down. Install PWA 85262 Guide into end of coupling.

(3) Following assembly procedure should be accomplished as rapidly as possible.

  (a) Using proper gloves, position the No. 1.5 bearing on the coupling (mating mark up).

  (b) Install PWA 85263 Drift to pilot on rod of guide on coupling. Drift bearing to seat on coupling.

  (c) Leave the drift on the bearing until it cools to 75° − 85°F (23.9° − 29.4°C).

  (d) Remove drift from coupling.

  (e) Make sure the inner race of the bearing has cooled to 75° − 85°F (23.9° − 29.4°C) before you continue with the assembly procedure.

(4) Install seal seat over coupling with "REAR" up and butt against bearing.

(5) Install retaining nut to secure bearing and seal seat. Refer to Table 1001 for the correct combinations of tools.

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Anchor Plate	PWA Pump	PWA Cart
85516	85517	33732	-----	28814 or 29510	75046
85516	85517	18872	-----	28814 or 29510	75046 or 28815
85265	85264	87354	88100	28814 or 29510	75046
85265	85264	80070	88100	28814 or 29510	75046

Matrix Of Tools Used To Torque The Retaining Nut
Table 1001

LPC/LPT COUPLING − ASSEMBLY−02

(6) Install an adapter into coupling, aligning splines. Install a torque wrench on coupling, aligning slots in wrench with slots in retaining nut. Install a hydraulic wrench on the torque wrench. If applicable, install an anchor plate on the hydraulic wrench.

(7) (Reference 972) Torque nut as follows:

(a) Tighten nut to 2200 − 2800 lb−in. (248.567 − 316.357 N.m). Turn nut through angle of 11 − 12 degrees 12 minutes. Loosen nut to zero. R R

(b) Tighten nut to 2200 − 2800 lb−in. (248.567 − 316.357 N.m).

(c) Establish common reference points between nut and its mating part.

R R (d) Turn nut through angle of 11 − 12 degrees 12 minutes.

(e) Loosen nut to zero and repeat step (b).

(f) If nut reference point is in line with mating part reference point or beyond it within 2 degrees maximum, apply final angle of turn per step (d).

(g) If reference points are not within limits, repeat steps (c), (d) and (e) in order until reference points are within limits. Then perform step (f).

(8) Remove tooling from coupling.

(9) Check, with a 0.001 inch (0.025 mm) feeler gage, that the seal seat and bearing are correctly seated on the coupling. The seal seat and bearing are correctly seated if you are unable to fit the 0.001 inch (0.025 mm) feeler gage between the coupling shoulder, bearing and seal seat.

(10) Install key washer to nut and coupling. Install retaining ring to secure key washer.

(11) Install protector around bearing and seal seat.

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - LPC/LPT Coupling

FAN CASE − HOW TO USE

Task 72−33−00−990−003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Fan Case parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED − This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED − This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

FAN CASE	72−33−00
FAN CASE ASSEMBLY	72−33−01
FAN EXIT CASE AND VANE ASSEMBLY	72−33−02

(Task 72-33-00-990-003)

FAN CASE - DESCRIPTION AND OPERATION

Task 72-33-00-990-002:

1. Fan Case

See Figure 1.

A. Fan Case - General

(1) Between the inlet cowl and the airframe supplied fan exhaust hardware are three separate fan cases whose purpose is to contain and direct the fan discharge airstream and to provide the structural link between the airframe and the core engine. They are the fan case assembly, the fan exit case and vane assembly, and the fan exit rear case. The fan case assembly and the fan exit case and vane assembly, including the 2.5 bleed valve and linkage, comprise the fan cases and are addressed here. The fan exit rear case is integral to the intermediate case and is addressed in the intermediate case section.

B. Fan Case Assembly

(1) The strengthened stainless steel fan case assembly supports the inlet cowl and provides for containment of the fan blades. Abradable fan blade rubstrip segments, which are made by an injection molding process that requires no finish machining, are secured to the ID of the fan case assembly with adhesive and mechanical retention. The fan case assembly is supported by mechanical attachment to the outer fan exit case.

C. Fan Exit Case And Vane Assembly

(1) The fan exit case and vane assembly consists of an aluminum outer case, an aluminum inner case assembly and eighty-four fan exit vanes that span the two cases. At the front the outer case supports the fan case assembly while at the rear the outer case itself is supported by mechanical attachment to the fan exit rear case. The inner case assembly supports the LPC stator assembly at the front while itself being supported at the rear by mechanical attachment to the intermediate case. The fan exit vanes, made of a composite material, are designed to straighten the fan discharge airstream prior to the air entering the airframe supplied fan exhaust hardware.

PW V

Fan Cases
Figure 1 (Sheet 2)
(Task 72−33−00−990−002)

FAN CASE − DESCRIPTION AND OPERATION

(1) The 2.5 bleed valve assembly is attached to the fan exit inner case assembly at the LPC exit. The purpose of this bleed valve is to ensure stable operation at low power levels and to increase stall margin during starting and when required at other operating conditions. The bleed system is actuated through linkages by a hydraulic cylinder mounted on the intermediate case. Bleed air is exhausted through the inner fan exit case assembly into the fan discharge airstream to provide maximum diffusion of the bleed air and minimum effect on the fan discharge airstream.

FAN CASE - DISASSEMBLY-01

Task 72-33-00-030-001:

1. Disassemble The Fan Case

A. Equipment And Materials Required

Special Tools:

PWA 26520	Sling, Lifting
PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85570	Bracket (4 Necessary)
PWA 85676	Adapter, (Front Fan Case) Lift And Trunnion (2 Necessary) (Optional to PWA 86423)
PWA 85678	Stand (3 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85750	Blocks, Support (4 Necessary) (Optional to PWA 87166/PWA 101960)
PWA 85982	Adapter, (Fan Exit Case And Vane Assembly) Lift And Trunnion (2 Necessary)
PWA 86423	Adapter Lift And Trunnion (2 Necessary)
PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 87518	Adapter, Lifting (3 Necessary)
PWA 101224	Dolly, Support
PWA 101960	Adapter, Support (3 or 4 Necessary)

B. Procedure

Subtask 72-33-00-030-051:

(1) Put the fan case in the vertical position - front end down (when stored in a PWA 87078 Stand or a PWA 85450 Stand). See Figure 501.

(a) Attach a hoist to PWA 76155 Sling .

(b) Attach the sling to two PWA 76154 Adapters.

(c) Open the clamps of the stand the fan case is in. Remove the detail ball lock pins.

(d) Install Adapters PWA 76154 on the lift and trunnion adapters already on the fan case.

(e) Lift the fan case from the stand.

FAN CASE - DISASSEMBLY-01

(f) Turn the fan case to front end down (vertical) position.

(g) There are three options for the vertical support of the fan case (front end down). See Figure 502.

1 Put the fan case on a pallet.

2 Use three PWA 85678 Stands or PWA 87166 Stands with three PWA 101960 Adapters to support the fan case.

3 Use four PWA 101224 Support Dollys with four PWA 101960 Adapters or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

(h) Remove the PWA 85698 Adapters or PWA 86431 Adapters from the fan case.

(2) Move apart the fan exit case and vane assembly (called case and vane assembly) from the front fan case. See Figure 502.

(a) Remove the Flange B hardware as follows. Refer to 72-33-00 Disassembly-21 (Task 72-33-00-030-021).

(b) Attach four PWA 85570 Brackets, equally spaced, to the top flange of the fan case. Use the detail bolts, washers, spacers, and nuts.

(c) Attach a hoist to PWA 26520 Sling.

(d) Attach the sling to the brackets.

(e) Lift the case and vane assembly.

(3) Put the case and vane assembly in a stand.

(a) Attach PWA 85982 Adapter to the case and vane assembly at 3 and 9 o'clock. Use the detail bolts, washers, and nuts.

(b) Attach a hoist to PWA 76155 Sling.

(c) Attach the sling to two PWA 76154 Adapters.

(d) Install PWA 85982 Adapters in PWA 76154 Adapters.

(e) Turn the case and vane assembly to horizontal position.

(f) Install the case and vane assembly in either PWA 87078 Stand or PWA 85450 Stand.

1 Move the detail hand knobs.

2 Remove the detail ball lock pins.

3 Open the tops of the detail clamps.

4 Install the case and vane assembly in the stand.

5 Lock the case and vane assembly in position with the detail ball lock pins.

6 Close the tops of the detail clamps.

7 Lock the detail clamps with the detail hand knobs.

8 Remove the PWA 76154 Adapters, sling, hoist, and brackets.

(4) Put the front fan case away.

(a) To put the front fan case in vertical position, do as follows.

1 Either leave it where it is

2 Or with four PWA 85570 Brackets attached to the top flange, PWA 26520 Sling, and a hoist, move it to a pallet. Remove the tools.

3 Use three PWA 87518 Adapters, with a sling, to move only the fan case vertically, front end up.

(b) To put the front fan case in horizontal position, do as follows.

1 Attach two PWA 86423 Adapters or PWA 85676 Adapters to the front fan case at 3 and 9 o'clock positions.

2 Attach a hoist to PWA 76155 Sling.

FAN CASE - DISASSEMBLY-01

3 Attach the sling to two PWA 76154 Adapters.

4 Install the adapters on the front fan case in the adapters on the sling.

5 Lift the front fan case.

6 Turn the front fan case to horizontal position.

7 Install the front fan case in either PWA 87078 Stand or PWA 85450 Stand.

  a Move the detail hand knobs.

  b Remove the detail ball lock pins.

  c Open the top of the detail clamps.

  d Install the front fan case in the stand.

  e Lock the front fan case in position with the detail ball lock pins.

  f Close the tops of the detail clamps. Lock the detail clamps with the detail hand knobs.

8 Remove the PWA 76154 Adapters, sling, and hoist.

Subtask 72-33-00-030-053:

(5) Remove bolts and washers securing bleed valve ducts, and screens. Remove ducts and screens. See Figure 504.

Subtask 72-33-00-030-054:

(6) If required, remove Flange A brackets.

(7) If required, remove the Flange A1 hardware as follows. Refer to 72-33-00, Disassembly-20 (Task 72-33-00-430-020).

(8) Remove Flange B1 hardware as follows. Refer to 72-33-00, Disassembly-22 (Task 72-33-00-430-022).

(9) Remove Flange B2 hardware as follows. Refer to 72-33-00, Disassembly-23 (Task 72-33-00-430-023)..

(10) Remove fan exit case bleed valve duct covers, if required. See Figure 505.

Subtask 72−33−00−030−052:

(11) Remove the compressor bleed actuator as follows. See Figure 506 and Figure 507.

CAUTION: THE SHOULDER BOLT HAS LEFT HAND THREADS. TURN THE SHOULDER BOLT IN THE CORRECT DIRECTION.

(a) Remove the cotter pin from the shoulder bolt in the actuator. Discard the cotter pin. While you hold the piston shaft, remove the shoulder bolt from the actuator.

(b) Remove the four bolts and washers that attach the compressor bleed actuator to the case and vane assembly. Remove the actuator with the rod end clevis and connecting link assembly.

(c) Remove the cotter pin, collar, and self−retaining pin that attach the rod end clevis to the bell crank connecting link assembly. Discard the cotter pin.

(d) Remove the rod end clevis from the piston shaft in the actuator. The rod end clevis is threaded into the piston shaft.

(e) Remove the two adapters from the actuator. Remove and discard the packings.

Subtask 72−33−00−030−056:

(12) (Pre SB PW4ENG 72−659) Remove bell crank parts as follows. See Figure 506 (Sheet 1).

(a) Remove the cotter pin, collar, and self−retaining pin that attach the bell crank assembly to the connecting link assembly. Discard the cotter pin.

(b) Remove the cotter pin and self−retaining pin that attach the bell crank assembly to the bell crank bracket. Discard the cotter pin.

(13) (Post SB PW4ENG 72−659) Remove bell crank parts as follows. See Figure 506 (Sheet 2).

(a) Remove the nut, washer and bolt that attach the bell crank assembly to the connecting link assembly.

(b) Remove the nut, two bearings and bolt that attach the bell crank assembly to the bell crank bracket. Discard the cotter pin.

(14) Remove the bleed valve assembly from the fan case. To remove the assembly, turn it in the slots of the fan case.

Subtask 72−33−00−030−055:

(15) (Post SB PW4ENG 72−346) Remove the six bolts that keep the bellcrank bracket in position. Remove the bracket. See Figure 507.

CAUTION: IF YOU WANT TO STORE THE CASE AND VANE ASSEMBLY IN VERTICAL POSITION, YOU MUST STORE IT FRONT END DOWN. IF YOU DO NOT STORE IT FRONT END DOWN, YOU WILL DAMAGE THE VANES.

(16) There are three options to put the case and vane assembly in the vertical position (front end down).

(a) Put the fan case on a pallet.

(b) Use three PWA 85678 Stands or PWA 87166 Stands with three PWA 101960 Adapters to support the fan case.

(c) Use four PWA 101224 Support Dollys with four PWA 101960 Adapters or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

(17) Remove the tools.

C. Postrequisites

FAN CASE - DISASSEMBLY-02

Task 72-33-00-030-002:

1. Disassemble Bleed Valve

A. Equipment And Materials Required - None

B. Procedure

Subtask 72-33-00-030-057:

(1) Remove the cotter pins, nut, and self-retaining pin that attach the bell crank assembly to the bleed valve. Remove the bell crank assembly. Discard the cotter pins and self-retaining pin. See Figure 501. R

Subtask 72-33-00-030-058:

(2) Remove cotter pins and nuts securing cam follower dampers to bleed valve. Discard cotter pins. Remove cam follower dampers, washers and spacers from bleed valve (8 places).

(3) (Pre SB PW4ENG 72-660) Remove the cotter pins and nuts securing cam follower to bleed valve. Discard cotter pins. Remove cam followers, washers and spacers from bleed valve (7 places).

(4) (Post SB PW4ENG 72-660) Remove the nuts that attach the cam follower to the bleed valve. Remove the cam followers, washers and spacers from the bleed valve (7 places).

FAN CASE - DISASSEMBLY-20

Task 72-33-00-030-020:

1. Remove The Flange A1 Brackets And Hardware

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Remove the Flange A1 brackets as follows. See Figure 501.

         (a) Tag and identify the flange A1 hardware for the correct bolthole locations.

            NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

         (b) Remove brackets from locations on Flange A1.

         (c) If equipped, remove vibration pick-up bracket from Flange A at approximately 1 o'clock position.

FAN CASE - DISASSEMBLY-21

Task 72-33-00-030-021:

1. Remove The Flange B Brackets And Hardware

A. Equipment And Materials Necessary

Special Tools:

PWA 87503	Handle, Nut (For the Airbus/McDonnell Douglas common parts configuration only)

B. Procedure

(1) Remove the Flange B brackets as follows. See Figure 501.

(a) Tag and identify the flange B hardware for the correct bolthole locations.

NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

(b) Use the PWA 87503 Nut Handle and remove nuts, washers, spacers and bolts that attach brackets to Flange B.

(c) Remove the brackets from the engine.

FAN CASE - INSPECTION/CHECK-01

Task 72-33-00-990-004:

1. General Inspection Requirements - Fan Case

   A. Organization Of Individual Part Or Subassembly Inspection Data

      (1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

      (2) Inspection/Check-00 section contains, where applicable:

         (a) Part number(s) for which the inspection data is applicable.

         (b) Service Bulletin numbers applicable to part number(s).

         (c) Inspection/Check numbers, data categories and applicability data.

      (3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

         (a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

         (b) Identification of mechanical disassembly required prior to inspection.

         (c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

         (d) Identification of part/subassembly cleaning required prior to inspection.

      (4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

         (a) Fluorescent Penetrant Method

         (b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−33−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−33−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−33, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

  (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

  (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

FAN CASE − INSPECTION/CHECK−04

Task 72−33−00−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126) [.005 [(0.13)	0.019 (0.482) .022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

FAN CASE - ASSEMBLY-01

Task 72-33-00-400-001:

1. Assemble The Fan Case

A. Prerequisites

(1) Assemble the fan exit case and vane assembly. See 72-33-02, Assembly-01 Task 72-33-02-440-001.

(2) Assemble the bleed valve. Refer to 72-33-00, Assembly-02 Task 72-33-00-400-002.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 26520	Sling, Lifting
PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85570	Bracket, Handling (4 Necessary)
PWA 85676	Adapter, (Front Fan Case) Lift And Trunnion (2 Necessary) (Optional to PWA 86423)
PWA 85677	Bracket, Handling
PWA 85678	Stand (3 Necessary) (Optional to PWA 87166/ PWA 101960)
PWA 85698	Adapter, Lift And Trunnion (2 Necessary) (Optional to PWA 86431)
PWA 85750	Blocks, Support (4 Necessary) (Optional to PWA 87166/ PWA 101960)
PWA 85928	Adapter, Torque
PWA 86423	Adapter, Lift And Trunnion, Fan Case (2 Necessary)
PWA 86431	Adapter, Lift And Trunnion (2 Necessary)
PWA 87078	Stand, Storage/Transport
PWA 87166	Stand, Support (3 Necessary)
PWA 101224	Dolly, Support
PWA 101960	Adapter, Support (3 or 4 Necessary)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	1	72-33-00/12/130
Cotter Pin	1	72-33-00/12/150
Cotter Pin	1	72-33-00/12/160
Cotter Pin	1	75-32-00/01/130
Packing	1	75-32-00/01/140
Packing	1	75-32-00/01/160

C. Procedure

Subtask 72-33-00-430-051:

R (1) Install the bleed ducts. See Figure 1001 (Sheet 1).

R (a) Apply Engine Oil P03-001 to the 84 bolts that you
R will use to install the bleed valve ducts.

R (b) Use the lubricated bolts to install the bleed
R ducts into fan exit case and vane assembly.
R Install the bleed ducts at fourteen locations,
R with screens installed under ducts at eight
R locations above the horizontal centerline, and
R washers installed at twelve locations.

R (c) Torque the bolts to 36 - 40 lbf-in. (4.067 -
R 4.519 N.m).

R (d) Install clip nuts (64 total) to each bleed duct
R with nuts toward inner diameter of fan exit case.
R Do not use the six clip nuts at the locations
R shown in Figure 1001 (Sheet 2).

Subtask 72-33-00-430-061:

(2) (Post SB PW4ENG 72-346) Install the bell crank bracket assembly as follows. See Figure 1002 and Figure 1007 (Sheet 1) or Figure 1007 (Sheet 2) as applicable.

(a) Align the holes in the bracket with the mating holes in the fan exit case and vane assembly (called case and vane assembly).

(b) Apply Engine Oil P03−001 to the threads of six bolts. Attach the bracket to the case and vane assembly with the six bolts. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

Subtask 72−33−00−430−055:

(3) If the front fan case is in horizontal position, put the front fan case in vertical position. See Figure 1003.

NOTE: If the front fan case stays in horizontal position, it is permitted to use PWA 85677 Bracket on the case to attach a hoist to.

(a) Attach a hoist to PWA 76155 Sling.

(b) Put a PWA 76154 Adapter in each hook of the sling.

(c) Prepare the stand for removal of the front fan case.

1 Move the detail hand knobs that are on the clamps of the stand.

2 Remove the detail ball lock pins.

3 Open the top part of the detail clamps.

(d) Put the spools of PWA 85676 Adapters or PWA 86423 Adapters on the front fan case in the keyholes of the PWA 76154 Adapters.

(e) With the hoist and sling, lift the front fan case.

(f) Turn the front fan case so that it is front end down.

(g) There are three options that can be used to put the front fan case in the vertical position.

1 Put the front fan case on a pallet.

2 Use three PWA 85678 Stands or PWA 87166 Stands with three PWA 101960 Adapters to support the fan case.

3 Use four PWA 101224 Support Dollys with four PWA 101960 Adapters or PWA 85750 Adapters to support the fan case. The fan case assembly can be moved with this support system.

(h) Remove the adapters, sling, and hoist.

(4) If the fan exit case and vane assembly (called case and vane assembly) is in horizontal position, put it in vertical (front end down) position.

(a) Attach a hoist to PWA 76155 Sling.

(b) Put PWA 76154 Adapter in each hook of the sling.

(c) Prepare the stand for removal of the case and vane assembly.

1 Move the detail hand knobs that are on the clamps of the stand.

2 Remove the detail ball lock pins.

3 Open the top part of the detail clamps.

(d) Put the spools of the adapters on the case and vane assembly case in the keyholes of the PWA 76154 Adapters.

(e) With the hoist and sling, lift the case and vane assembly.

(f) Turn the case and vane assembly so that it is front end down.

(5) Attach the case and vane assembly to the front fan case.

(a) Attach four PWA 85570 Brackets, equally spaced, to the top flange of the case and vane assembly. Use the detail bolts, washers, spacers, and nuts.

(b) Attach PWA 26520 Sling to a hoist.

(c) Attach the sling to the four brackets.

FAN CASE - ASSEMBLY-01

(d) Lift the case and vane assembly.

(e) If PWA 85982 Adapters are attached to the case and vane assembly at 3 and 9 o'clock, remove them.

(f) Align the dowel pin at 6:30 o'clock on the front fan case rear flange with the mating hole in the case and vane assembly. Put the case and vane assembly on the front fan case.

(g) Install the Flange B hardware as follows. Refer to 72-33-00, Assembly-21 (Task 72-33-00-430-021).

(6) Put the fan case in horizontal position as follows: See Figure 1005.

(a) Attach two PWA 86431 Adapters or PWA 85698 Adapters to the fan case at 3 and 9 o'clock with the detail cap screws, washers, and nuts.

(b) With a hoist, PWA 76155 Sling and two PWA 76154 Adapters installed over the adapters on the fan case, lift the fan case.

(c) Install the fan case in either PWA 87078 Stand or PWA 85450 Stand as follows.

1 Move the detail hand knobs that are on the clamps of the stand.

2 Remove the detail ball lock pins.

3 Open the top of the detail clamps.

4 Install the fan case in the stand.

5 Lock the fan case in position with the detail ball lock pins.

6 Close the detail clamps.

7 Lock the detail clamps with the detail hand knobs.

(d) Remove the hoist, sling, and PWA 76154 Adapters.

Subtask 72-33-00-430-060:

(7) If previously removed, install the Flange A1 hardware as follows. Refer to 72-33-00, Assembly-20 (Task 72-33-00-430-020).

(8) If previously removed, install Flange B1 hardware as follows. refer to 72-33-00, Disassembly-22 (Task 72-33-00-030-022).

(9) If previously removed, install Flange B2 hardware as follows. refer to 72-33-00, Disassembly-22 (Task 72-33-00-030-023).

(10) If previously removed, install hole covers. Secure with bolts, threads lubricated with Engine Oil P03-001. Torque bolts to 75 - 85 lb-in. (8.474 - 9.604 N.m). See Figure 1006.

Subtask 72-33-00-430-062:

(11) Install the bleed valve assembly in the fan case as follows. See Figure 1007.

- (a) With the small OD of the bleed valve to the rear, install the bleed valve in the fan case.
- (b) Turn the bleed valve to engage the cam followers in the slots of the fan exit inner case.
- (c) Push the bleed valve to the rear.

Subtask 72-33-00-430-063:

(12) (Pre SB PW4ENG 72-659) Attach the bell crank assembly to the bell crank bracket that is in the fan exit inner case at 4:30 o'clock, as follows. See Figure 1007 (Sheet 1).

- (a) Install a self-retaining pin through the bell crank and bracket.
- (b) Install cotter pins in the bell crank and self retaining pin. Bend the legs of the cotter pins.
- (c) Do a check of the bleed valve to be sure that it does not stick. To do the check, move the bell crank with your hand.

(13) (Post SB PW4ENG 72-659) Attach the bell crank assembly to the bell crank bracket that is in the fan exit inner case at 4:30 o'clock, as follows. See Figure 1007 (Sheet 2).

(a) Install two bushings into the bell crank.

(b) Install a bolt through the bell crank and bracket.

(c) Install a nut onto end of the bolt. Measure and record the run-on torque necessary to advance the nut self-locking feature on the bolt threads.

(d) Torque the bolt to 370 - 410 lb-in. (41.804 - 46.324 N.m) in addition to the run-on torque as recorded above.

(e) Do a check of the bleed valve to be sure that it does not stick. To do the check, move the bell crank with your hand to make sure that it moves freely.

Subtask 72-33-00-430-064:

(14) Install the compressor bleed actuator (called actuator) in the fan case as follows. See Figure 1007.

NOTE: The shoulder bolt of the actuator is installed during the rigging procedure.

(a) Install new packings, lubricated with Engine Oil P03-001, on two adapters. Install the adapters, threads lubricated with Engine Oil P03-001, in the holes in the actuator. Torque the smaller adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m). Torque the larger adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(b) Align the hole in the connecting link assembly with the holes in the rod end clevis. Install a pin in the side of the clevis with the chamfered hole. Hit the pin lightly with a hammer. The head of the pin must touch the clevis.

(c) Install a collar on the pin. Install a cotter pin in the collar. Bend the legs of the cotter pin.

(d) Align the actuator piston shaft with the rod end clevis. Turn the rod end clevis clockwise to engage the internal thread of the piston shaft.

(e) From the rear of the fan case, put the actuator with the rod end clevis and connecting link in position over the four-hole boss that is at 7:30 o'clock.

CAUTION: BE SURE TO USE THE CORRECT TORQUE READING. REFER TO THE STANDARD PRACTICES MANUAL, PN 585005, 70-52, FOR THE NECESSARY TORQUE ADJUSTMENT WITH A WRENCH EXTENSION.

(f) Attach the actuator to the case with four washers and four bolts, lubricated with Engine Oil P03-001. Tighten the bolts with your hand. With PWA 85928 Torque Adapter, torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(g) Install the free end of the connecting link in the remaining free clevis of the bell crank assembly. If necessary, turn the rod end clevis and connecting link.

(h) (Pre SB PW4ENG 72-659) Install a self-retaining pin through the bell crank and connecting link. Hit the pin lightly so that the head of the pin touches the bell crank.

(i) (Pre SB PW4ENG 72-659) Install a collar on the self-retaining pin.

(j) (Pre SB PW4ENG 72-659) Install a cotter pin in the collar. Bend the legs of the cotter pin.

(k) (Post SB PW4ENG 72-659) Install a bolt through the bell crank and connecting link. Install a washer and nut on the bolt.

(l) (Post SB PW4ENG 72-659) Torque the bolt to 65 - 75 lb-in. (7.344 - 8.474 N.m)

Subtask 72-33-00-360-001-001:

(15) Apply sealant to the self-retaining pins in the bell crank assembly as follows. See Figure 1008.

R
R

(a) Clean the self-retaining pins and cotter pins at Location C. Apply PWA 83-A4.

NOTE: See Standard Practices Manual, PN 585005 70-48, for the cleaning methods given above.

(b) Apply Sealant P09-014 at Location C.

D. Postrequisites

(1) Rig the compressor bleed actuator. Refer to Special Procedures-03, 72-00-00, Task 72-00-00-830-001 to manually rig the bleed valve actuator or 72-00-00, Special Procedure-24 Task 72-00-00-830-006 to hydraulically rig the bleed valve actuator.

Figure 1008
(Task 72-33-00-400-001)

Task 72-33-00-400-002:

1. Assemble Bleed Valve

A. Equipment And Materials Required

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-054	Paste, Antiseize (PWA 36246)
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

	PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
	Cotter Pin	1	72-33-00/12/40
	Cotter Pin	1	72-33-00/12/50
	Cotter Pin	15	72-33-00/12/100
R	Pin, Self Aligning	1	72-33-00/12/35

B. Procedure

NOTE: Instructions are with the bleed valve assembly (called bleed valve) small OD down on a bench.

Subtask 72-33-00-430-056:

(1) Install the bleed valve cam followers as follows. See Figure 1001 (Sheet 1) and Figure 1001 (Sheet 2).

CAUTION: ENGINES THAT ARE PRE SB PW4ENG 72-566, MUST USE ROUND HEAD TYPE CAM FOLLOWERS AND BE INSTALLED IN A FAN EXIT INNER CASE WITH CAM SLOTS THAT HAVE A SERVICEABLE LIMIT OF 0.850 INCH (21.590 mm) MAXIMUM WIDTH FOR ALL SEVEN SLOTS AS RECORDED DURING DETAIL INSPECTION OF THE
R FAN EXIT INNER CASE. REFER TO SECTION
R 72-33-04, INSPECTION/CHECK-04 IN THE
R PW4000 SERIES CIR, PN 51A357. ENGINES THAT ARE POST SB PW4ENG 72-566, BUT PRE SB PW4ENG 72-660, MUST USE SQUARE HEAD TYPE CAM FOLLOWERS AND BE INSTALLED IN A FAN EXIT INNER CASE WITH CAM SLOTS THAT HAVE A SERVICEABLE LIMIT OF 0.790 INCH (20.066 mm) MAXIMUM WIDTH FOR ALL

SEVEN SLOTS AS RECORDED DURING DETAIL INSPECTION OF THE FAN EXIT INNER CASE. ENGINES THAT ARE POST SB PW4ENG 72-660, HAVE STRONGER, LOW FRICTION ROLLER TYPE CAM FOLLOWERS AND STEEL CAM SLOT LINERS THAT HAVE AN ALUMINUM BRONZE COATING TO REDUCE FRICTION, SLOT WEAR WHICH, IN TURN, ELIMINATE BINDING. ALSO, THE 2.5 BLEED BEARING PADS ARE MADE OF A STRONGER AND MORE WEAR RESISTANT
R MATERIAL. REFER TO SECTION 72-33-04,
R INSPECTION/CHECK-04 IN THE PW4000
R SERIES CIR, PN 51A357. IF THE CORRECT PARTS ARE NOT INSTALLED FOR THE ABOVE CONFIGURATION, AS SPECIFIED, THE BLEED VALVE ASSEMBLY COULD MALFUNCTION AND SUBSEQUENTLY CAUSE DAMAGE TO THE ENGINE.

(a) (Reference 750) Assemble sleeve spacer (1001/1) to bleed valve (Location A, 7 places). Install bleed valve cam follower (1001/2) to each spacer on valve.

(b) (Pre SB PW4ENG 72-660) Lubricate threads with Engine Oil P03-001, and install washers and nuts. Torque nuts to 65 - 85 lb-in. (7.344 - 9.604 N.m).

(c) (Post SB PW4ENG 72-660) Lubricate the threads of the cam follower with Antiseize Paste P06-054, and install the washers and the nuts. Wipe off unwanted paste. Torque the nuts to 125 - 140 lb-in. (14.123 - 15.818 N.m).

(d) (Pre SB PW4ENG 72-660) Secure nuts with cotter pins. Bend tangs of pins around nuts.

Subtask 72-33-00-430-057:

(2) Install the bleed valve dampers as follows. See Figure 1001 (Sheet 3).

(a) Assemble sleeve spacer (1001/3) to bleed valve (Location F, 8 places). Install bleed valve cam follower damper assembly (1001/4) to each spacer.

(b) Lubricate threads with Engine Oil P03-001, and install washers and nuts. Torque nuts to 65 - 85 lb-in. (7.344 - 9.604 N.m).

(c) Secure nuts with cotter pins. Bend tangs of pins around nuts.

Subtask 72-33-00-430-059:

(3) (Pre SB PW4ENG 72-660) Apply sealant to the pins at Location A.

(a) Clean cotter pin areas and both ends of pins by SPOP 208 Wipe Method. SeeStandard Practices Manual, PN 585005, 70-21-00. Surfaces shall be thoroughly dried in air at ambient temperatures. Drying time shall be sufficient to remove traces of solvent detrimental to sealant.

(b) Apply Silicone Rubber Sealant P09-014, to pins and both ends of cotter pins at locations shown in referenced figure.

Subtask 72-33-00-430-058:

(4) Install the bell crank assembly on the bleed valve as follows. See Figure 1002.

(a) Align the hole in the bearing of the bell crank with the holes in the clevis on the bleed valve.

R (b) Install a new self-retaining pin through the clevis and the bell crank.

(c) Install a cotter pin in the self-retaining pin. Bend the legs of the cotter pin.

(d) Install a nut, threads lubricated with Engine Oil P03-001, on the self-retaining pin. Torque the nut to 24 - 36 lb-in. (2.712 - 4.067 N.m).

(e) Install a cotter pin in the nut. Bend the legs of the cotter pin.

Task 72-33-00-430-020:

1. Install The Flange A1 Brackets And Hardware

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Consumable Materials:

Item No.	Designation
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P03-001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install Flange A1 hardware as follows. See Figure 1001.

(a) Lubricated the bolts threads with Engine Oil P03-001.

(b) Install brackets to Flange A1 and secure with bolts, washers and nuts.

(c) Torque nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(d) If applicable position vibration pickup bracket to rear of Flange A at approximately 1 o'clock position.

(e) Lubricated the bolts threads with Engine Oil P03-001.

(f) Secure the vibration pickup bracket with bolts.

(g) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m).

(h) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

FAN CASE - ASSEMBLY-21

Task 72-33-00-430-021:

1. Install The Flange B Brackets And Hardware

A. Equipment And Materials Necessary

Standard Tools:
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 87503	Handle, Nut (For the Airbus/McDonnell Douglas common parts configuration only)

Consumable Materials:

Item No.	Designation
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P03-001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install Flange B hardware as follows. See Figure 1001.

(a) Lubricated the bolts threads with Engine Oil P03-001.

(b) Use the PWA 87503 Nut Handle and attach brackets to Flange B and secure with bolts, washers, spacers, and nuts.

(c) Tighten and torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(d) (Reference 491) Check gap between cases at ID of Flange B to be within 0.000 - 0.020 inch (0.000 - 0.508 mm).

(e) If applicable position vibration pickup bracket to rear of Flange A at approximately 1 o'clock position.

(f) Lubricated the bolts threads with Engine Oil P03-001.

(g) Secure the vibration pickup bracket with bolts.

(h) Torque bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m).

(i) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

FAN EXIT CASE AND VANE ASSEMBLY − DISASSEMBLY−01

Task 72−33−02−040−001:

1. Disassemble The Fan Exit Case And Vane Assembly

A. Equipment And Materials Required

Standard Tools:
No. 10 Torq−set Drive

Special Tools:
PWA 76154 Adapter, Lift And Trunnion (2 Necessary)
PWA 76155 Sling

B. Procedure

(1) Remove the fan exit liner segment assemblies (called liners). See Figure 501.

(a) Cut the sealant at the edges of the liners.

(b) Remove the screws that attach the liners. Use a No. 10 Torq−set Drive.

CAUTION: BE VERY CAREFUL WHEN YOU REMOVE A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE LINER.

(c) Remove the liners.

(2) Remove the fan exit case and vane assembly (called case and vane assembly) from the stand. See Figure 502.

(a) Turn the case and vane assembly to vertical position (vanes down).

(b) Put PWA 76155 Sling in a hoist. Put two PWA 76154 Adapters on the sling.

(c) Install the spools of the adapters on the case and vane assembly in Adapters PWA 76154.

(d) Move the detail hand knobs on the clamps of the stand. Remove the ball lock pins. Open the clamps.

(e) Lift the case and vane assembly.

FAN EXIT CASE AND VANE ASSEMBLY - DISASSEMBLY-01

CAUTION: WITH THE CASE AND VANE ASSEMBLY IN REAR END DOWN POSITION, YOU MUST SUPPORT THE OUTER CASE. IF YOU DO NOT, YOU WILL DAMAGE THE VANES.

(f) Carefully put the case and vane assembly on a correct surface, vanes down.

(3) Remove the fan exit (outer) case (called outer case). See Figure 503 and Figure 504.

NOTE: It is possible that some of the vane boltholes in the fan exit (outer) case were repaired with a bushing. There is no washer at these positions.

(a) (Pre SB PW4ENG 72-262) Remove the lockwire that attaches the vane attachment bolts to the fan exit (outer) case. Remove the bolts and washers.

(b) (Post SB PW4ENG 72-262) Remove the nuts, washers, and, if applicable, brackets from the slab-bolts at the OD of the case and vane assembly. Sealant covers the heads of the slab-bolts on the underside of the outer fairings. Mechanically remove the sealant. Remove the slab-bolts.

(c) Lift the fan exit (outer) case and put it on a pallet. Remove the hoist, sling, and adapters from the (outer) case.

(4) Remove the base and vane assemblies (called vanes) as follows. See Figure 505.

R (a) If it is there, carefully cut and mechanically
R remove the sealant from between the fan exit guide
R vane bases.

(b) Remove the vanes from the inner case in a clockwise direction (as viewed from the front).

(c) Remove the inner and outer fairings from the vanes.

(d) Put the vanes in a storage rack.

(Task 72-33-02-040-001)

Task 72-33-02-440-001:

1. Assemble The Fan Exit Case And Vane Assembly

A. Equipment And Materials Necessary

Standard Tools:
No. 10 Torq-set Drive

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport (Optional to PWA 87078)
PWA 85982	Adapter, Lift And Trunnion (2 Necessary)
PWA 87078	Stand, Storage/Transport

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P09-014	Sealant, Silicone Rubber (PWA 36003)
P09-029	Sealant, Silicone Rubber (PWA 36029)

B. Procedure

Subtask 72-33-02-360-053:

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER BASE AND VANE ASSEMBLY. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-262.

(1) Install the vanes on the fan exit inner case assembly (called inner case). See Figure 1001.

(2) Install the fan exit (outer) case (called outer case) on the vanes. See Figure 1002, Figure 1003 and Figure 1004.

(a) Install two PWA 85982 Adapters on the outer case at 3 and 9 o'clock positions. With a hoist, two PWA 76154 Adapters, and PWA 76155 Sling, lift the outer case.

CAUTION: YOU MUST USE A SUPPORT UNDER THE OUTER CASE. IF YOU DO NOT, YOU WILL DAMAGE THE VANES.

(b) With the outer case rear end down (bolt holes down), put the outer case on a correct surface over the vane and inner case assembly. Align the holes in the outer case with the mating part on the vane. See Figure 1002.

CAUTION: FOR THESE MODELS: 4152, 4156A, 4158 DO NOT USE WASHERS AT THE BOLTHOLES IN THE FAN EXIT (OUTER) CASE WITH BUSHINGS IN THEM. IF YOU DO, YOU WILL DAMAGE THE CASE AND VANE ASSEMBLY.

(c) FOR THESE MODELS: 4152, 4156A, 4158
R (Pre SB PW4ENG 72-262) For engines that use hex
R head bolts, apply Engine Oil P03-001 to the threads of 168 bolts. Attach the outer case to the vanes with 168 washers and the bolts. Torque the bolts to 74 - 82 lb-in. (8.361 - 9.265 N.m). Install Lockwire P05-289. See Figure 1003.

CAUTION: DO NOT USE WASHERS AT THE BOLTHOLES IN THE FAN EXIT (OUTER) CASE WITH BUSHINGS IN THEM. IF YOU DO, YOU WILL DAMAGE THE CASE AND VANE ASSEMBLY.

R (d) For engines that use slab-head bolts, apply Engine Oil P03-001 to the threads of 168 slab-bolts. Install the bolts through the vane, outer fairing, and outer case. Install washers and nuts on the bolts. Torque the nuts to 85 - 95 lb-in. (9.604 - (10.734 N.m). See Figure 1004.

NOTE: Engines with the common Airbus-McDonnell Douglas fan case externals sales order option, have eight brackets attached to the slab-bolts at the top left of the outer case. To install these brackets, first put the brackets and bolts in position over the mating slab-bolts, then install the nuts (no washers at these positions), then tighten to the same torque as above.

R (e) For engines that use slab−head bolts, clean and fill the holes where the heads of the slab−bolts are, as follows:

Subtask 72−33−02−360−001−001:

R 1 Clean the surfaces the sealant will touch. Use PWA 83−D4 Task 70−48−00−360−001. See section 70−48 in the Standard Practices Manual, PN 585005.

R 2 Fill the hole with Sealant P09−029. The sealant must be 0.040 inch (1.016 mm) above or below the adjacent surfaces.

R NOTE: Do the fill operation at room temperature in a room that has 25 percent minimum relative humidity.

R NOTE: It is permitted to have 0.060 inch (1.524 mm) surface voids in the rubber sealant.

Subtask 72−33−02−360−051:

(3) Store the fan exit case and vane assembly (called case and vane assembly). See Figure 1005.

(a) With PWA 76154 Adapters, PWA 76155 Sling, and a hoist, install the case and vane assembly in either PWA 87078 Stand or PWA 85450 Stand.

(b) Remove the hoist, sling, and adapters.

R (4) Install the fan exit liner segment assemblies (called liners). See Figure 1006.

CAUTION: BE VERY CAREFUL WHEN YOU INSTALL A LINER SEGMENT. IT IS POSSIBLE THAT THERE ARE WASHERS ATTACHED TO THE LINER. IT IS EASY FOR THESE WASHERS TO BECOME DISCONNECTED FROM THE LINER.

(a) Apply Engine Oil P03−001 to 106 screws. Attach the liners to the case and vane assembly with the screws. It is necessary to use the correct length of screw at the trailing edge. Refer to Table 1001.

NOTE: Screw length is a function of washer thickness at the trailing edge.

NOTE: (Engines with acoustical fan exit rear liner segment assemblies)

NOTE: Only a Class 6 washer is permitted at the trailing edge of the front liner.

Screw PN	Screw Length	Washer Thickness	Quantity of Screws
593111	0.495 - 0.505	0.000 - 0.015	0 - 36 As Necessary
ST1382-09	0.542 - 0.562	0.016 - 0.070	0 - 36 As Necessary
ST1382-10	0.594 - 0.625	0.071 - 0.130	0 - 36 As Necessary
ST1382-11	0.656 - 0.687	0.131 - 0.210	0 - 36 As Necessary

Fan Exit (Front) Liners - Washer Thickness And Screw Length
Table 1001

(b) With a No. 10 Torq-set drive, tighten and torque the screws to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(c) Use PWA 83-A4 Task 70-48-00-360-001 to clean the surfaces that will touch the sealant. See section 70-48 in the Standard Practices Manual, PN 585005.

(d) Apply Sealant P09-014 to the spaces between the liners. Do PWA 615 Task 70-48-00-360-002 as shown in section 70-48 in the Standard Practices Manual, PN 585005, except as follows:

1 Cure in air with a relative humidity of 20 percent, minimum at room temperature for 24 hours before engine run.

R

Subtask 72-33-02-360-054:

R (5) Optional (except for engines pre SB PW4ENG 72-591),
R apply Sealant P09-029 around the bases of the base and
R vane assemblies. See Figure 1006.

R NOTE: Engines that are pre SB PW4ENG 72-591 require
R sealant applied around the vane bases.

R NOTE: The optional sealant can be applied to help reduce erosion of the vane base material.

R (a) Remove any loose sealant.

R (b) Clean the areas that the sealant will touch. Refer to PWA 83−D4 (Task 70−48−00−360−001) in section 70−48, Standard Practices Manual, PN 585005.

R NOTE: The fan exit guide vane base material is polyetherimide.

R (c) Fill the spaces around the bases of the base and vane assemblies with Sealant P09−029. The surface of the sealant must be smooth and continuous and flush to 0.040 inch (1.016 mm) below the adjacent surface.

R (d) Remove excess sealant.

R (e) Cure the sealant in air with a relative humidity of 50 percent minimum at 75° F (23.9° C) or equivalent. Cure the sealant for 24 hours, minimum, before you touch the sealant.

R NOTE: The sealant is fully cured in 72 hours.

INTERMEDIATE CASE − DESCRIPTION AND OPERATION

Task 72−34−00−990−002:

1. Intermediate Case

See Figure 1.

A. Intermediate Case − General

(1) The intermediate case is a major structural member of the engine that supports the thrust bearings for both the LPC and HPC rotors. The No. 1 ball bearing is supported by a cone support attached to the inner front flange of the compressor intermediate case. The No. 2 ball bearing is supported by the inner rear flange of the compressor intermediate case. Two mount brackets located on the rear of the compressor intermediate case transmit the thrust generated by both rotors directly to the airframe structure. A puck arrangement on the upper rear face of the compressor intermediate case provides for an airframe structure connection to carry engine vertical and side loads.

(2) In addition to the compressor intermediate case assembly, the intermediate case group consists of the 4th stage compressor stator, the angle gearbox and the bevel gear, gearshaft and driveshaft assembly which transmit power from the HPC rotor (N2) to the gearbox group.

B. Compressor intermediate case Assembly

(1) A steel compressor intermediate case and an aluminum fan exit rear case are attached through nine steel struts to form the compressor intermediate case assembly, the main structural element of the intermediate case group.

(2) The compressor intermediate case is a large investment casting which supports the No. 1, 1.5 and 2 bearings and transmits the thrust loads generated by the LPC and HPC rotors to the airframe structure through two mount brackets. The primary (main gas generator) air−stream passes through the compressor intermediate case on its way from the LPC to the HPC. Aerodynamic panels attached to the OD provide the inner containment for the secondary (fan discharge) airstream.

STATOR ASSEMBLY
L−A0705 (0000)
PW V

Intermediate Case
Figure 1 (Sheet 2)
(Task 72−34−00−990−002)

INTERMEDIATE CASE − DESCRIPTION AND OPERATION

(3) The fan exit rear case is an aluminum weldment which at the front attaches to the fan exit case and vane assembly and at the rear to the airframe supplied fan exhaust hardware. Aerodynamic panels attached to the ID of the fan exit rear case provides the outer containment for the secondary (fan discharge) airstream.

(4) The nine struts that span the secondary (fan discharge) airstream are welded to the compressor intermediate case and are attached to the fan exit rear case by pin rivets to provide the stiffness required of this assembly.

C. Fourth Stage Compressor Stator Assembly

(1) The 4th stage compressor stator consists of 80 aluminum vanes retained in aluminum inner and outer shroud rings. The stator is bolted to the inner front flange of the compressor intermediate case. The vanes serve to direct the primary (main gas generator) airflow as it exits the LPC.

INTERMEDIATE CASE - DISASSEMBLY-01

Task 72-34-00-030-001:

1. Disassemble Intermediate Case

A. Equipment And Materials Necessary

Standard Tools:
1/4-28 Jackscrews (3 Necessary)

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 76155	Sling
PWA 85450	Stand, Storage/Transport
PWA 85662	Bracket, Support (2 Necessary - Optional To PWA 85667)
PWA 85667	Bracket, Support (2 Necessary)
PWA 102119	Fixture
PWA 102120	Fixture

B. Procedure

Subtask 72-34-00-030-051:

(1) Install PWA 85662 or PWA 85667 Bracket at the 3 and 9 o'clock locations on intermediate case with bolts provided. Using hoist, PWA 76154 Adapters, and PWA 76155 Sling raise case from assembly fixture and install in PWA 85450 Stand. Remove hoist and sling. Trunnion case to horizontal (flight position). See Figure 501.

Subtask 72-34-00-030-053:

(2) FOR THESE MODELS: 4152, 4156A, 4158
Remove the HPC secondary flow control valve, IDGS air/oil heat exchanger valve override solenoid as follows. See Figure 502.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the lockwire that attaches the pressure switch tube assembly to the IDGS air/oil heat exchanger valve override pressure switch and the solenoid adapters at approximately the 1 o'clock position on intermediate case. Remove the pressure switch tube from the engine.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the two bolts that attach the switch to the bracket and remove the switch.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Remove the four bolts that attach the solenoid to the case and remove the solenoid and the brackets.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Remove cap, adapters, plug, and gaskets from the solenoid. Install protective closures.

Subtask 72−34−00−030−063:

(3) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the turbine vane and blade cooling air valve, IDGS air/oil heat exchanger valve override solenoid as follows. See Figure 502A.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the lockwire that attaches the pressure switch tube assembly to the IDGS air/oil heat exchanger valve override pressure switch and the solenoid adapters at approximately the 1 o'clock position on intermediate case. Remove the pressure switch tube from the engine.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the two bolts that attach the switch to the bracket and remove the switch.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the four bolts that attach the solenoid to the case and remove the solenoid and the brackets.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the cap, adapters, plug, and gaskets from the solenoid. Install protective closures.

Subtask 72−34−00−030−060:

(4) Remove the start/stability bleed valve solenoid at 5 o'clock position as follows. See Figure 503.

INTERMEDIATE CASE − DISASSEMBLY−01

(a) Remove the lockwire and disconnect the (AA35), (AA36), and (AA37) bleed valve supply tubes. Remove any clamp installations that attach the tubes. Remove the tubes. Remove the four bolts and bracket. Remove the solenoid. Remove the cap, adapters, plug, and gaskets from the solenoid. Install the protection covers.

NOTE: The bracket attached to the solenoid is for (Post SB PW4ENG 75−41) engines only.

Subtask 72−34−00−030−062:

(5) Remove the four bolts that attach the brackets and the stability bleed pneumatic relay valve to intermediate case. Remove the brackets and valve. Remove the three bolts and nuts that attach the valve to the bracket. Remove the valve. Remove the adapters and gaskets from the valve. Install the protection covers.

NOTE: The clamp bracket attached to the solenoid support bracket is for (Post SB PW4ENG 75−41) engines only.

Subtask 72−34−00−030−061:

(6) FOR THESE MODELS: 4152, 4156A, 4158
Remove the HPC secondary flow control valve, turbine vane and blade cooling air valve solenoid as follows. See Figure 504.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the four bolts that attach the HPC secondary flow control valve, turbine vane and blade cooling air valve solenoid to the intermediate case at approximately the 10 o'clock position.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Remove the solenoid and bracket from the case. Remove the caps, adapters, and gaskets from the solenoid. Install protective closures.

Subtask 72−34−00−030−064:

(7) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the turbine vane cooling air valve, turbine vane and blade cooling air valve solenoid as follows. See Figure 504A.

INTERMEDIATE CASE - DISASSEMBLY-01

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove the four bolts that attach the turbine vane cooling air valve, turbine vane and blade cooling air valve solenoid to the intermediate case at approximately the 10 o'clock position.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Remove the solenoid and bracket from the case. Remove the caps, adapters, and gaskets from the solenoid. Install protective closures.

(8) Use PWA 102120 Fixture to remove the main bearing (oil) pressure tube assembly from the tube connector in the intermediate case at approximately the 9 o'clock position. See Figure 505.

R (9) Remove the main bearing (outer) scavenge tube assembly from the scavenge tube (elbow) assembly in the intermediate case at approximately the 7:30 o'clock position. See Figure 505.

R (a) Get the PWA 102119 Fixture.

R (b) Install the two detail studs through two holes in the scavenge tube flange and into the intermediate case.

R (c) Screw the locating pin into the last threaded hole.

R (d) Turn the collar nut counter-clockwise until it is near the T-handel.

R (e) Turn the C-washer away from the threaded rod, and remove the support assembly from the tube assembly.

R (f) Put the tube assembly into the scavenge tube. With the tube assembly not fully into the scavenge tube, align the locating pin with the clearance hole in the support and put the support on the threaded rod.

R (g) Put the tube assembly into the scavenge tube.

R (h) Align the two studs with the clearance holes in the support. When the support hits the knurled stop of the locating pin, turn the check nuts and make the support level.

R (i) Move the C-washer so it covers the slot in the
R support and turn the collar nut until it stops
R against the C-washer.

R (j) Turn the T-handle counter-clockwise to loosen the
R scavenge tube from the intermediate case.

R (k) Remove the Fixture details from the scavenge tube.
R Remove the two studs and locating pin from the
R intermediate case.

R (l) Remove the two studs and locating pin from the
R intermediate case, and store the details in the
R support detail.

R (m) Remove the scavenge tube from the intermediate
R case. Discard the packings.

(10) Remove the engine mount nuts and lock plates from the engine mount boss at the 12 o'clock position on the rear of the intermediate case as follows: See Figure 506.

(a) Remove the safety wire from the two bolts (506/3).

(b) Remove the bolts (506/3) at two locations and remove the nuts and lock plate assembly from the intermediate case,.

(c) Remove the engine mount nuts (506/1) from the engine mount lock plates (506/2).

INTERMEDIATE CASE - DISASSEMBLY-02

Task 72-34-00-030-002:

1. Disassemble Intermediate Case Parts

A. Equipment And Materials Required

Special Tools:
PWA 12126 Base
PWA 85011 Wrench
PWA 85012 Puller (Optional To PWA 102000 Puller)
PWA 85199 Fixture
PWA 85251 Adapter
PWA 85252 Bracket
PWA 85259 Drift
PWA 85363 Plate, Disassembly
PWA 102000 Puller

Subtask 72-34-00-030-058:

B. Remove The Tube And Nozzle Assemblies

(1) Install PWA 85251 Adapter on PWA 85199 Fixture. Install the 1.5 bearing support assembly on the adapter with three clamps. See Figure 501.

(2) Remove the gearbox drive (oil) nozzle assembly (502/5) from the 1.5 bearing support assembly. See Figure 502.

(3) Remove the gearbox drive (oil) pressure tube assembly (502/4) from both the nozzle assembly and the No. 1.5 and 2 bearing tube connector assembly (502/2).

  (a) If applicable, discard the packing.

(4) Remove the No. 2 bearing (oil) nozzle assembly (502/1) from the tube connector.

  (a) Remove the metering plug from the tube connector.

(5) Remove the No. 1.5 bearing (oil) nozzle assembly (503/1) from the tube connector. See Figure 503.

  (a) Remove the metering plug from the tube connector.

(6) Remove the tube connector (503/2) from the 1.5 bearing support assembly (503/3).

C. Remove The No. 1.5 And 2 Bearing (Carbon) Seal Assembly (Called Seal Assembly)
See Figure 504.

(1) Remove the bolts and washers that attach the seal assembly to the No. 1.5 bearing support assembly.

(2) Remove the seal assembly.

Subtask 72-34-00-030-059:

D. Remove The Gearbox Drive Bevel Gearshaft And Related Parts
See Figure 505.

(1) Remove the gearbox drive deflector.

  (a) Remove the bolts and nuts that attach the deflector and ball bearing outer race to the 1.5 bearing support assembly.

Figure 505
(Task 72-34-00-030-002)

- (b) Remove the deflector.
- (2) Remove the gearbox driveshaft coupling.
  - (a) Remove the retaining ring.
  - (b) Carefully pull out the coupling.
- (3) Remove the bearing retaining nut. Use PWA 85011 Wrench. See Figure 506.
  - (a) Attach PWA 85252 Bracket to the top inner flange of the 1.5 bearing support assembly at the 6 o'clock position.
  - (b) Un−bend the key washer on the gearshaft.
  - (c) Install the wrench on the gearshaft.
    - 1 Align the splines of the wrench with the internal splines of the gearshaft.
    - 2 Align the teeth of the wrench with the slots in the nut.
    - 3 Hold the wrench in place with the detail washer and nut.
  - (d) Remove the nut.
- (4) Remove the outer half of the ball bearing inner race with PWA 102000 or PWA 85012 Puller. See Figure 507.

  NOTE: PWA 102000 Puller will attach to all towershaft bearings. PWA 85012 Puller will attach to only PN 50A046, 50A048, 51G992 and 51G993 towershaft bearings.

  - (a) Put the plug in the gearshaft.
  - (b) Adjust the jackscrew to engage the detail jaw in the puller groove of the inner race.
  - (c) Install the ring detail.
  - (d) Remove the outer half of the inner race.
- (5) Remove the bearing outer race and balls. See Figures 505 and 507.
- (6) Remove the inner half of the ball bearing inner race with PWA 102000 or PWA 85012 Puller.
  - (a) Put the plug in the gearshaft.
  - (b) Adjust the jackscrew to install the detail jaw behind the inner race.
  - (c) Install the ring detail.
  - (d) Remove the inner race.
  - (e) Remove the spacer from the gearshaft.
  - (f) Remove (PWA 85252) Bracket.
- (7) Remove the gearshaft and roller bearing inner race and rollers from the 1.5 bearing support assembly. See Figure 505.
- (8) Remove the roller bearing inner race from the gearshaft.
  - (a) Install PWA 85363 Plate on the gearshaft under the inner race.

INTERMEDIATE CASE - INSPECTION/CHECK-01

Task 72-34-00-990-004:

1. General Inspection Requirements - Intermediate Case

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check-00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

  - (c) Magnetic Particle Method
  - (d) X−ray Method
  - (e) Ultrasonic Method
  - (f) Hardness Check
  - (g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

  - (a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

    NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

  - (b) Allowable blending for visual damage, which may be accomplished within the inspection area.

    NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

  - (a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

  - (a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

  - (a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−34−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−34−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

  (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

  (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

INTERMEDIATE CASE - INSPECTION/CHECK-03

Task 72-34-00-990-005:

1. Visual Inspection - Intermediate Case
   A. For inspection requirements applicable to installed (accessible) parts of intermediate case see 72-00-34, Inspection/Check-XX (Task 72-00-31-XXX-XXX).

Previous Pageblock Return to Previous Menu Next Pageblock

INTERMEDIATE CASE - INSPECTION/CHECK-04

Task 72-34-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Task 72-34-00-200-005:

1. Functional Check - Vacuum Check No. 2 Bearing Compartment

This Section Has Been Relocated To Assembly-01

INTERMEDIATE CASE - ASSEMBLY-01

Task 72-34-00-400-001:

1. Assemble The Intermediate Case

A. Prerequisites

(1) Determine gear spacer thickness. See 72-34-00, Assembly-02 Task 72-34-00-400-002.

(2) Assemble the No. 1.5 bearing support assembly with the gearbox drive bevel gearshaft and bearings. See 72-34-00, Assembly-03 Task 72-34-00-400-003.

(3) Assemble No. 2 bearing and seal assembly. See 72-34-04, Assembly-03 Task 72-34-04-440-002.

B. Equipment And Materials Required

Standard Tools:

Rubber Plug 1.420 Inch (36.068 mm)
Rubber Plug 1 Inch (25.400 mm)
Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

CTE 6075	Cart, Vacuum
PWA 76154	Adapter (2 Required)
PWA 76155	Sling
PWA 85000	Adapter, Lifting
PWA 85001	Adapter
PWA 85002	Arm, Lift And Trunnion (Optional to PWA 101720)
PWA 85005	Fixture
PWA 85029	Adapter, Lifting
PWA 85450	Stand, Storage/Transport
PWA 85473	Cover, Vacuum Check (3 Required)
PWA 85474	Cover, Vacuum Check
PWA 85475	Plug, Vacuum Check (Optional to PWA 101110)
PWA 85476	Cover, Vacuum Check
PWA 85480	Adapter, Vacuum Check
PWA 85662	Bracket, Support (2 Required - Optional to PWA 85667)
PWA 85667	Bracket, Support (2 Required)
PWA 85668	Weight (For Horizontal Assemblies)
PWA 86287	Fixture, Loading (For Vertical Assemblies)
PWA 87552	Crimper, Finish Bend

INTERMEDIATE CASE − ASSEMBLY−01

Special Tools:

(CONTINUED)

PWA 87553	Crimper, Prebend
PWA 101110	Plug, Vacuum Check
PWA 101720	Arm, Lift and Trunnion

Consumable Materials:

	Item No.	Designation
	P03−001	Oil, Engine (PWA 521B)
	P05−004	Tape, Magic Mending
	P05−289	Lockwire (AS3214−02)
	P05−291	Cable, Safety (Optional)
	P05−292	Ferrule, Safety Cable (Optional)
	P06−002	Petrolatum, White (PMC 9609)
R	P06−054	Paste, Antiseize (PWA 36246)
	P09−027	Sealant, Silicone Rubber (PWA 36003−2)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	77−32−00/1/10
Key	2	72−34−00/12/30
Key Washer	3	72−34−00/4/156
Key Washer	4	72−34−00/11/30

C. Procedure

Subtask 72−34−00−430−067:

(1) Install PWA 85662 Bracket or PWA 85667 Bracket at the 3 and 9 o'clock locations on intermediate case with bolts provided. Using hoist, PWA 76154 Adapters, and PWA 76155 Sling, install case into PWA 85450 Stand. Remove hoist and sling. Trunnion case to horizontal (flight position). See Figure 1001.

Subtask 72−34−00−430−052:

(2) For engines with a boss on the intermediate case at 11 o'clock (Pre SB PW4ENG 72−86):

(a) Install new packing, lubricated with Engine Oil P03−001, to groove on cover. Install cover to outer case at approximately 11 o'clock location.

(b) Secure cover with four bolts, threads lubricated with Engine Oil P03−001, and key washers.

(c) Tighten and torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend tabs to secure bolts.

Subtask 72−34−00−430−068:

(3) Temporarily install the No. 1.5 bearing support assembly (called support assembly) in the compressor intermediate case assembly. See Figure 1002.

(a) Attach PWA 85000 Adapter to the front flange of the support assembly with four hex head bolts.

(b) Attach PWA 101720 Arm or PWA 85002 Arm to the lift holes in the adapter with ball lock pins.

(c) Attach a hoist to the arm and raise the support assembly.

(d) Attach the support assembly to the rear inner flange of the intermediate case assembly with workbolts.

Subtask 72−34−00−430−063:

(4) Temporarily install the No. 2 bearing and seal assembly (called bearing and seal assembly). See Figure 1003.

(a) Install PWA 85001 Adapter on the No. 2 bearing and seal assembly (called bearing and seal assembly).

1 Put the rod of the adapter through the center of the bearing and seal assembly.

2 With the detail nut, attach the front half of the adapter to the rear half of the adapter.

(b) Attach PWA 101720 Arm or PWA 85002 Arm to the adapter with the detail ball lock pins.

(c) With a hoist, lift the bearing and seal assembly.

(d) Attach the bearing and seal assembly to the intermediate case and the support assembly.

1 Install 33 workbolts in the rear flange of the No. 1.5 bearing support assembly.

2 Tighten and torque the bolts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

(e) Remove the arm and adapter from the support assembly. Remove the arm from the bearing and seal assembly.

Subtask 72-34-00-430-069:

(5) Do a check of the gear backlash. See Figure 1004.

(a) Attach PWA 85005 Fixture to the No. 2 bearing support assembly (Pre SB PW4ENG 72-204).

1 Align a tab on the support assembly with a slot in the fixture.

2 Rotate the fixture to mis-align the tabs and slots.

3 Tighten the four clamps.

(b) Attach PWA 85005 Fixture to the No. 2 bearing support assembly (Post SB PW4ENG 72-204).

1 Attach the fixture to the rear flange of the support assembly with the detail screws.

(c) Attach PWA 85005 Fixture to the adapter with the detail ball lock pins. Turn the detail hex head bolt until the detail force gage shows a value of 80 − 120 lb. (355.0 − 533.8 N.).

(d) (For an intermediate case that is in horizontal position) Install PWA 85668 Weight in the hole at the bottom of the support assembly.

NOTE: It is possible to do a check of the backlash with PWA 85668 Weight, Change C, with the angle gearbox installed.

1 Remove the detail weight.

2 Turn the knob to collapse the jaws.

3 Hang the tool from the inside of the gearbox drive bevel gearshaft.

4 Attach the detail weight to the tool.

NOTE: The weight applies a load of 15 − 25 lb. (66.7 − 111.2 N.).

(e) (For an intermediate case that is in vertical position) Install PWA 86287 Fixture in the bore of the intermediate case.

1 Turn the knob to collapse the jaws.

2 With the lip of the jaws behind the inner ID of the gearbox drive bevel gearshaft, and holding the detail tube with a wrench, turn the knob to expand the jaws.

3 Put the detail collar into the bore of the intermediate case.

4 Turn the detail nut until it touches the detail collar.

5 Turn the detail nut back 1/8 turn. This applies the correct load to the bevel gearshaft.

(f) (Reference 203) Do a check of the backlash.

1 Attach a standard gage holder to the assembly.

2 Put the point of a dial indicator at the middle position of a tooth of the gearbox drive bevel gearshaft.

3 With your hand, push the gearbox drive bevel gearshaft to make it gently move back and forth.

4 Read and write the maximum value on the dial indicator. The maximum value permitted is 0.024 − 0.038 inch (0.61 − 0.97 mm) in the plane of rotation.

5 Remove the gage holder and dial indicator.

6 If the backlash check is not in the limits, it is necessary to do as follows.

a Check the classified spacer in the No. 2 bearing and seal assembly. Refer to 72−34−04, Assembly−03 Task 72−34−04−440−002.

b Check the classified spacer in the No. 1.5 bearing and seal assembly. Refer to 72−34−00, Assembly−02 Task 72−34−00−400−002.

(g) Remove the weight, fixture, and adapter from the bearing and seal assembly.

Subtask 72−34−00−430−070:

(6) Do a vacuum check of the No. 2 bearing compartment. See Figure 1005.

(a) Install PWA 85476 Cover on the gearbox drive bevel gear.

1 Remove the nut, washer, and clamp from the cover.

2 Install the detail cover from the rear to touch the seal seat.

3 Put the detail clamp on the threaded rod. The clamp must touch the gear.

4 Attach the cover with the detail washer and nut.

(b) Attach PWA 85473 Cover to each of three pads: breather (12 o'clock), oil pressure (9 o'clock) and oil scavenge (7:30 o'clock).

  1 Attach one cover to the pad in the 12 o'clock strut with bolts, handtight.

  2 Attach another cover to the pad at 9 o'clock with bolts, handtight.

  3 Attach the third cover to the pad at 7:30 o'clock with bolts, handtight.

  NOTE: If the oil scavenge tube (elbow) is installed, install a rubber plug in the tube in place of the cover.

(c) Put a rubber plug in the hole at 6 o'clock.

(d) Install PWA 101110 Plug or PWA 85475 Plug.

  1 Locate the N1 speed sensor hole at 5:00 o'clock.

  2 Lubricate packings with White Petrolatum P06−002. Install plug through intermediate case outer boss until it is in the chamfer.

(e) Install PWA 85474 Cover.

  1 Locate the three hole pad adjacent at 4:30 o'clock.

  2 If neither the N1 bearing transducer nor cover is there, attach the cover to the pad with bolts, handtight.

(f) Attach PWA 85480 Adapter to front of intermediate case with detail cap screws, handtight.

(g) Attach vacuum hose and pressure sense line from CTE 6075 Vacuum Cart to the adapter. Do the vacuum check.

  1 Necessary vacuum: vacuum cart pressure must be set at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute).

2 (Pre SB PW4ENG 72−245) Airflow must not exceed 8 lbs. (3.63 kg) per hour.

3 (Post SB PW4ENG 72−245) Airflow must not exceed 5 lbs. (2.27 kg) per hour.

(h) Disconnect lines from cover. Remove the vacuum check tools.

(7) Remove the support assembly and bearing and seal assembly.

(a) Install the PWA 85000 Adapter, arm, and hoist on the support assembly.

(b) Install PWA 85001 Adapter, arm, and hoist on the No. 2 bearing and seal assembly.

(c) Remove the 33 workbolts from the flange of the support assembly.

(d) Remove the support and bearing and seal assemblies.

(e) Put the support assembly on a bench. Remove the tools. Put a cover on the support assembly to protect it.

(f) Put the bearing and seal assembly on a bench. Remove the tools. Put a cover on the assembly to protect it.

Subtask 72−34−00−430−071:

(8) Install the main bearing scavenge tube (elbow) assembly. See Figure 1006.

(a) Apply Engine Oil P03−001 to the threads of four bolts.

(b) Attach the tube assembly to the pad on the intermediate case with four key washers and the four bolts.

(c) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(d) Bend the tabs of the key washers.

Subtask 72−34−00−430−072:

(9) Install the main bearing (outer) scavenge tube assembly. See Figure 1006.

- (a) Apply Engine Oil P03−001 to three new packings. Install the packings on the tube assembly.
- (b) Install the tube assembly in the intermediate case at 7:30 o'clock. Install the outer end of the tube assembly in the scavenge tube (elbow) assembly.

Subtask 72−34−00−430−075:

(10) Install the tube connector. See Figure 1006.

- (a) Apply Engine Oil P03−001 to the threads of four bolts.
- (b) Attach the tube connector to the pad on the intermediate case with four key washers and the four bolts.
- (c) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).
- (d) Bend the tabs of the key washers.

(11) Install the main bearing (oil) pressure tube assembly. See Figure 1006.

- (a) Apply Engine Oil P03−001 to three packings. Install the packings on the tube assembly.
- (b) Install the tube assembly in the intermediate case at 9 o'clock. Install the outer end of the tube assembly in the tube connector.

Subtask 72−34−00−430−054:

(12) Install the angle gearbox. See Figure 1007.

- (a) Trunnion the intermediate case to vertical (front end down) position.
- (b) Attach a new pin stop to each support bracket with bolts, lubricated with Engine Oil P03−001. Tighten the bolts with your fingers.

(c) Install the brackets on the pins at the sides of the angle gearbox.

(d) Twist the bent end of the of the stop counterclockwise until it touches the ID of the pin.

(e) While you hold the pin stops, torque the bolts to 32 − 36 lb−in. (3.616 − 4.067 N.m).

(f) Bend the keys on the stops.

(g) Apply Engine Oil P03−001 to one packing. Put the packing in the groove at the top of the angle gearbox.

(h) Install PWA 85029 Adapter on the rear flange of the angle gearbox with three detail bolts. With a hoist, lift the gearbox. Put it in the correct position in the intermediate case.

(i) Attach the angle gearbox to the intermediate case.

  1 Apply Engine Oil P03−001 to the threads of four bolts.

  2 (Pre SB PW4ENG 72−438) Attach the angle gearbox with the bolts through the support brackets. Torque the bolts to 225 − 300 lb−in. (25.422 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

  3 (Post SB PW4ENG 72−438) Put the two key washers in the correct position against the support brackets. Attach the angle gearbox with the bolts through the key washers and support brackets. Torque the bolts to 275 − 300 lb−in. (31.071 − 33.895 N.m). Bend the tabs of the key washers against the bolts. Use PWA 87553 Crimper, then use PWA 87552 Crimper.

(j) Remove the adapter.

(k) Trunnion the intermediate case to horizontal (flight) position.

Subtask 72−34−00−430−073:

(13) (Reference 138) Install the fan exit case flange assembly on the intermediate case. See Figure 1008.

(a) Install the flange assembly at the flange assembly on the intermediate case.

(b) Install two keys in the lugs of the intermediate case struts. Use the correct class of key. The class of key is correct if there is no empty space between the key and the case. Refer to the figure. Bend the keys as shown in the figure.

(c) Clean Areas K and CH. Use PWA 83−A4. See Standard Practices Manual, PN 585005.

(d) Fill Area K with Sealant P09−027. Cure the sealant in room temperature air of 20 percent minimum relative humidity. Cure the sealant for eight hours, minimum, before engine operation.

(e) Fill Area CF with Sealant P09−027. Cure the sealant in room temperature air of 25 percent minimum relative humidity. Cure the sealant for two hours, minimum, before you touch the part.

Subtask 72−34−00−430−074:

(14) (Post SB PW4ENG 77−19) If the engine does NOT have a No. 1 bearing (vibration) transducer, install a cover. See Figure 1009.

(a) Apply Engine Oil P03−001 to two packings.

(b) Put the packing on the cover.

(c) Apply Engine Oil P03−001 to the threads of three bolts.

(d) Attach the cover to the pad on the ID of the intermediate case at 4:30 o'clock. Use three key washers and the three bolts. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend the tabs of the key washers.

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER CONDUIT AND ATTACHING PARTS. INTERCHANGEABILITY IS AFFECTED. REFER TO (SB PW4ENG 77−13).

(15) If the engine HAS a No. 1 bearing (vibration) transducer, install the transducer conduit.

(a) Install a packing on the conduit.

1 Apply Engine Oil P03−001 to the packing.

2 Install it in the packing groove under the flange of the conduit.

(b) Install a gasket under the flange of the conduit.

(c) Attach the conduit to the boss at 4:30 o'clock (rear view) on the intermediate case.

1 Apply Engine Oil P03−001 to the threads of three bolts.

2 Attach the conduit to the intermediate case with three key washers and the three bolts.

3 Torque the bolts to 85 − 95 lb−in. (9.604 − 10.7 N.m). Bend the tabs of the key washers.

4 Apply Engine Oil P03−001 to the threads of one clamp−bolt.

5 Clamp the conduit to the boss on the inside of the intermediate case with a clamp, spacer (if applicable), the bolt, and a nut.

6 Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m).

7 Install protective covers.

Subtask 72−34−00−430−064:

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER BRACKET. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 77−13.

(16) Install brackets to intermediate case at 5 o'clock position and secure with four bolts, threads lubricated

with Engine Oil P03-001, and torque to 85 - 95 lb-in. (9.064 - 10.734 N.m). See Figure 1010. Remove protective closures from stability bleed pneumatic relay valve. Install gaskets to adapters and install adapters, threads lubricated with Engine Oil P03-001, to three threaded ports. Torque largest adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m). Torque smallest adapter to 65 - 75 lb-in. (7.344 - 8.474 N.m). Torque medium adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install valve to bracket and secure with three bolts, threads lubricated with Engine Oil P03-001, and nuts. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: For engines with the revised bleed valve supply tube clamp installation (Post SB PW4ENG 75-41), the clamp bracket must be aligned during the installation of the bracket attached to the solenoid. See Figure 1010 (Sheet 1).

Subtask 72-34-00-430-065:

(17) Remove protective closures from start/stability bleed valve solenoid. See Figure 1010. Install two gaskets to two adapters and install adapters, threads lubricated with Engine Oil P03-001, to two adjacent ports in solenoid. Torque adapters to 65 - 75 lb-in. (7.344 - 8.474 N.m). Install three gaskets to two adapters and one plug. Install adapters and plug, threads lubricated with Engine Oil P03-001, to three ports at rear of valve solenoid. Torque plug and smaller adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m). Torque larger adapter to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(18) Install solenoid to bracket at 5 o'clock position and secure with four bolts, lubricated with Engine Oil P03-001 (and bracket Post SB PW4ENG 75-41). Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: For engines with the revised clamp installations (Post SB PW4ENG 75-41), the two clamp brackets must align per Figure 1010 (Sheet 1). Loosen and torque the bolts again if necessary.

(19) Install the (AA35) bleed valve supply tube assembly, threads at elbow end lubricated with Engine Oil P03−001, and threads at straight end lubricated with Antiseize Paste P06−054, refer to figure and tighten by hand. Remove unwanted paste. For (Post SB PW4ENG 75−41) engines install clamps, bolt, lubricated with Engine Oil P03−001, and nut that attach the tube to the bracket. Torque the bolt to 36 − 40 lb−in. (4.067 − 4.519 N.m). Torque elbow end to solenoid to 90 − 100 lb−in. (10.169 − 11.298 N.m). Torque straight end to relay valve adapter to 65 − 75 lb−in. (7.344 − 8.474 N.m). Install cap, threads lubricated with Engine Oil P03−001, to solenoid adapter adjacent to tube and torque to 90 − 100 lb−in. (10.169 − 11.298 N.m). Secure tube and cap with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(20) For engines with the (AA37) bleed valve supply tube maintenance break at 5 o'clock position (Post SB PW4ENG 75−28) install tubes as follows.

(a) Remove protective closures from the (AA36) and (AA37) bleed valve supply tubes.

(b) Lubricate all tube threads with Antiseize Paste P06−054. Remove unwanted paste.

(c) Attach the (AA36) and (AA37) tubes per figure and tighten by hand.

(d) Install clamps, bolts, lubricated with Engine Oil P03−001, spacer, and nuts as necessary per figures. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(e) Torque the larger (AA37) tube nut to 225 − 250 lb−in. (25.422 − 28.246 N.m). Torque the smaller (AA36) tube nut to 200 − 225 lb−in. (22.597 − 25.422 N.m). Secure tubes with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

Subtask 72−34−00−430−055:

(21) FOR THESE MODELS: 4152, 4156A, 4158
Install the HPC secondary flow control valve, IDGS air/oil heat exchanger valve override solenoid as follows. See Figure 1011.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protective closures from the solenoid.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install two gaskets to the two adapters and install the adapters, threads lubricated with Engine Oil P03−001, to the ports on the top of of the solenoid. Torque the adapters to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install three gaskets to the two adapters and one plug and install the adapters and plug, threads lubricated with Engine Oil P03−001, to the three ports at the rear of the solenoid. Torque the plug and smaller adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m). Torque the larger adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

Subtask 72−34−00−430−076:

(22) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the turbine vane and blade cooling air valve, IDGS air/oil heat exchanger valve override solenoid as follows. See Figure 1011A.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the protection covers from the solenoid.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install two gaskets to the two adapters and install the adapters, threads lubricated with Engine Oil P03−001, to the ports on top of the solenoid. Torque the adapters to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install three gaskets to the two adapters and one plug and install the adapters and plug, threads lubricated with Engine Oil P03−001, to the three ports at the rear of the solenoid. Torque the plug and smaller adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m). Torque the larger adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(23) Install the solenoid to the intermediate case at approximately the 1 o'clock position with two brackets. Attach with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(24) Install the IDGS air/oil heat exchanger valve override pressure switch to the bracket and attach with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(25) Install the pressure switch tube assembly, threads at the elbow end lubricated with Engine Oil P03−001 and
R threads at the straight end lubricated with Antiseize
R Paste P06−054, to the switch and solenoid. Remove
R unwanted paste. Torque the elbow end to the solenoid adapter to 90 − 100 lb−in. (10.169 − 11.298 N.m). Torque the straight end to the pressure switch adapter to 65 − 75 lb−in. (7.344 − 8.474 N.m). Install cap, threads lubricated with Engine Oil P03−001, to the remaining adapter on the top of the solenoid and torque to 90 − 100 lb−in. (10.169 − 11.298 N.m). Safety the tube and cap with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

Subtask 72−34−00−430−066:

(26) FOR THESE MODELS: 4152, 4156A, 4158
Install the HPC secondary flow control valve, turbine vane and blade cooling air valve solenoid as follows. See Figure 1012.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the protective closures.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install the two gaskets to the adapters and install the adapters, threads lubricated with Engine Oil P03−001, to the two adjacent ports on the top of the solenoid. Torque the adapters to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(c) FOR THESE MODELS: 4152, 4156A, 4158
Install two caps, threads lubricated with Engine Oil P03−001, to the same adapters and torque the caps to 90 − 100 lb−in. (10.169 − 11.298 N.m). Safety the caps with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Install three gaskets to the two smaller adapters and one larger adapter and install the adapters, threads lubricated with Engine Oil P03−001, to the ports on the rear of the solenoid. Torque the smaller two adapters to 110 − 120 lb−in. (12.428 − 13.558 N.m). Torque the larger adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

Subtask 72−34−00−430−077:

(27) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the turbine vane cooling air valve, turbine vane and blade cooling air valve solenoid as follows.
R See Figure 1012 (Sheet 2).

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the protection covers from the turbine vane cooling air valve, turbine vane and blade cooling air valve solenoid.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install two gaskets to the two adapters and install the adapters, threads lubricated with Engine Oil P03−001, to the two adjacent ports on the top of the solenoid. Torque the adapters to 65 − 75 lb−in. (7.344 − 8.474 N.m).

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install two caps, threads lubricated with Engine Oil P03−001, to the same adapters and torque the caps to 90 − 100 lb−in. (10.169 − 11.298 N.m). Safety the caps with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install three gaskets to the two smaller adapters and one larger adapter and install the adapters, threads lubricated with Engine Oil P03−001, to the ports on the rear of the solenoid. Torque the smaller two adapters to 110 − 120 lb−in. (12.428 − 13.558 N.m). Torque the larger adapter to 150 − 170 lb−in. (16.948 − 19.207 N.m).

(28) Install the solenoid and bracket to the intermediate case at approximately the 10 o'clock position and attach with four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

Subtask 72−34−00−430−079:

R (29) Install the engine mount nuts and lock plate at two
R locations as follows: See Figure 1013.

R (a) Apply Engine Oil P03−001 to the two bolts (1013/3)
R you will use to install the lock plates.

R (b) Assemble two engine mount nuts (1013/1) to the
R engine mount lock plate (1013/2).

R (c) Install the nuts and lock plate assembly to the
R engine mount boss at the 12 o'clock position
R on the rear of the intermediate case with a
R lubricated bolt (1013/3).

R (d) Tighten and torque the bolt to 65 − 85 lb−in.
R (7.344 − 9.604 N.m).

R (e) Safety the bolt with Lockwire P05−289.

Subtask 72−34−00−430−057:

R (30) Using hoist, adapters, and sling, raise case from build stand and install front end down into assembly fixture/workstand.

D. Postrequisites

(1) Assemble the No. 1.5 bearing support assembly with the tube and nozzles. Refer to 72−34−00, Assembly−04 Task 72−34−00−400−004.

R Engine Mount Nuts And Lock Plates Installation
R Figure 1013
R (Task 72-34-00-400-001)

Task 72-34-00-400-002:

1. Determine Gear Spacer Thickness

A. Equipment And Materials Required

Special Tools:

PWA 85006 Gage, Mounting Distance
PWA 85021 Fixture, Loading
PWA 85199 Fixture
PWA 85251 Adapter

B. Procedure
See Figure 1001.

Subtask 72-34-00-430-060:

(1) Install No. 1.5 bearing support to PWA 85251 Adapter which is attached to PWA 85199 Fixture mounted on bench. The support is attached to side of adapter with three clamps. Rotate support to working position.

(2) Install PWA 85006 Gage. See Figure 1002.

(a) Set dial indicator to zero by positioning indicator and holder on locating post of setting master.

(b) Rotate the holder to position the indicating point perpendicular to the upright gaging plate of the master.

(c) Adjust indicator to obtain 0.100 - 0.125 inch (2.540 - 3.175 mm) travel of needle from initial contact with upright gaging surface on master.

(d) Lock indicator on holder and rotate dial face of indicator to align zero with needle point.

(e) Insert post of the detail base through bore of towershaft boss of support. Secure in position with cover detail and knurled nut.

(f) Attach the body of the gage to the bearing support.

Subtask 72-34-00-430-061:

(3) Measure Dimension "M".

(a) Position dial indicator and holder over post of detail base and rotate holder to align indicator point with center of post on detail body.

(b) Measure distance from rear face of bearing support to point of intersection of centerline of two bearing bores with axis through center of rear locating diameter perpendicular to rear face.

(c) Observe amount dial indicator moves from original zero position. Add this reading to 4.695 inches (119.253 mm) and record as Dimension "M". This dimension is needed to accomplish 72−34−04, Assembly−03 (Task 72−34−04−440−002). R

Subtask 72−34−00−430−062:

(4) (Reference 205) Determine Spacer "AC".

(a) Measure Dimension "U".

1 Position dial indicator and holder to align indicator point with center of post on detail base. See Figure 1002.

2 Measure distance from outer face of towershaft boss to point of intersection of centerline of two bearing bores in towershaft boss with axis through center of rear locating diameter perpendicular to rear face.

3 Observe amount dial indicator moves from original zero position. Add this indicator reading to 10.939 inches (277.851 mm) and record as Dimension "U".

4 Remove PWA 85006 Gage.

(b) Measure Dimension "S". Measure distance from upper bearing shoulder to lower bearing shoulder on gearshaft. See Figure 1003.

(c) Measure Dimension "AA".

1 Measure distance from top face of bearing inner race to top face flange on outer race.

2 Use PWA 85021 Loading Fixture to apply required load to bearing for proper measurement. See Figure 1002.

(d) Spacer "AC" must have thickness equal to Dimension "U" minus total of "S", "AA" and 6.0261 inches (153.063 mm) within ± 0.001 inch (0.025 mm).

R (e) Select the classified spacer from Table 1001 that
R is necessary to do 72-34-00, Assembly-03 (Task
R 72-34-00-400-003). The faces of the spacer must be parallel in 0.0002 inch (0.0051 mm) total.

CLASS	DIMENSION-INCH (mm)
1	0.093 - 0.094 (2.363 - 2.387)
2	OVER 0.094 - 0.095 (2.388 - 2.413)
3	OVER 0.095 - 0.096 (2.413 - 2.438)
4	OVER 0.096 - 0.097 (2.439 - 2.463)
5	OVER 0.097 - 0.098 (2.464 - 2.489)
6	OVER 0.098 - 0.099 (2.490 - 2.514)
7	OVER 0.099 - 0.100 (2.515 - 2.540)
8	OVER 0.100 - 0.101 (2.540 - 2.565)
9	OVER 0.101 - 0.102 (2.566 - 2.590)
10	OVER 0.102 - 0.103 (2.591 - 2.616)
11	OVER 0.103 - 0.104 (2.617 - 2.641)
12	OVER 0.104 - 0.105 (2.642 - 2.667)
13	OVER 0.105 - 0.106 (2.667 - 2.692)
14	OVER 0.106 - 0.107 (2.693 - 2.717)
15	OVER 0.107 - 0.108 (2.718 - 2.743)
16	OVER 0.108 - 0.109 (2.744 - 2.768)
17	OVER 0.109 - 0.110 (2.769 - 2.794)
18	OVER 0.110 - 0.111 (2.794 - 2.819)
19	OVER 0.111 - 0.112 (2.820 - 2.844)
20	OVER 0.112 - 0.113 (2.845 - 2.870)
21	OVER 0.113 - 0.114 (2.871 - 2.895)
22	OVER 0.114 - 0.115 (2.896 - 2.921)
23	OVER 0.115 - 0.116 (2.921 - 2.946)
24	OVER 0.116 - 0.117 (2.947 - 2.971)
25	OVER 0.117 - 0.118 (2.972 - 2.997)
26	OVER 0.118 - 0.119 (2.998 - 3.022)

INTERMEDIATE CASE - ASSEMBLY-03

Task 72-34-00-400-003:

1. Assemble The No. 1.5 Bearing Support Assembly With The Gearbox Drive Bevel Gearshaft And Bearings

A. Prerequisites

(1) Determine gear spacer thickness. See 72-34-00, Assembly-02 Task 72-34-00-400-002.

B. Equipment And Materials Required

Special Tools:

PWA 85007	Base
PWA 85008	Drift
PWA 85010	Pusher
PWA 85011	Wrench
PWA 85252	Bracket, Retaining

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-045	Pen, Marker (PMC 4092)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	1	72-34-00/14/050

C. Procedure

Subtask 72-34-00-430-058:
See Figure 1001.

NOTE: The 1.5 bearing support assembly is still installed on PWA 85251 Adapter and PWA 85199 Fixture.

(1) Install the roller bearing inner race and rollers on the gearbox drive bevel gearshaft.

(a) Put the gearshaft, gear down, on PWA 85007 Base.

(b) Heat the roller bearing inner race. Refer to Standard Practices Manual, PN 585005.

(c) Install the inner race, mating number down, on the gearshaft.

(d) Seat the inner race on the lower bearing journal with PWA 85008 Drift and an arbor press.

(2) Install the roller bearing outer race in the 1.5 bearing support assembly.

(a) Lubricate the threads of four bolts with Engine Oil P03-001.

(b) Attach the outer race to the assembly with the four bolts.

(c) Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(3) Install the gearshaft in the support assembly.

(a) Put the gearshaft into the largest opening of the assembly.

(b) Seat the gearshaft in the assembly. The gearshaft is seated when the roller bearing parts are mated.

(c) Attach PWA 85252 Bracket to the assembly at 6 o'clock position. See Figure 1002. Use the two detail screws.

(4) Install the classified spacer that was selected in 72-34-00, Assembly-02 Task 72-34-00-400-002.

(a) Install it over the shaft of the gear.

(b) Seat it against the bearing shoulder.

(5) Install the ball bearing inner races on the gearshaft. Use PWA 85010 Pusher. See Figure 1002.

(a) Heat the inner races. See Standard Practices Manual, PN 585005.

(b) Install the inner half of the inner race (no puller groove).

1 Install the inner race on the gearshaft.

2 Install PWA 85010 Pusher in the gearshaft.

a Install the detail ring over the gearshaft.

b Turn the knob to retract the pin and collapse the jaw.

c Align the keys with the slots in the threads of the gearshaft.

d Put the jaw in the gearshaft.

e Turn the knob to extend the pin. This action expands the jaw.

f While you hold the rod with a wrench, turn the nut until the inner race is seated against the spacer.

3 Remove the pusher and detail ring.

(c) Install the bearing outer race and balls in the support assembly. Install workbolts in the bearing flange to hold it in place.

(d) Install the outer half of the inner race (with a puller groove).

1 Install the inner race on the gearshaft.

2 Install PWA 85010 Pusher in the gearshaft. Use the procedure that was just outlined, but omit installation of the detail ring.

(6) Install the remaining parts on the gearshaft. See Figure 1003.

(a) Install the key washer.

(b) (Reference 250) Install the nut.

1 Install the nut.

2 Use PWA 85011 Wrench. Engage the splines of the wrench with the internal splines of the gearshaft. Engage the teeth of the wrench with the slots in the bearing retaining nut. Use a 1/2 inch drive torque wrench and breaker bar.

3 Torque the nut to 1600 − 1700 lb−in. (180.776 − 192.074 N.m).

4 Secure the nut with the key washer. Refer to Standard Practices Manual, PN 585005.

(c) Install the gearbox driveshaft coupling in the gearshaft. See Figure 1001.

1 Align the splines of both parts.

2 Install the coupling.

3 Install the retaining ring in the groove inside the gearshaft.

(d) Attach the ball bearing outer race and deflector. See Figure 1004.

1 Lubricate the threads of three bolts with Engine Oil P03-001.

2 Attach the deflector and outer race with the three bolts (heads out) and nuts.

3 Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(7) Remove PWA 85252 Bracket from the support assembly. Remove the support assembly from the adapter and fixture.

INTERMEDIATE CASE - ASSEMBLY-04

Task 72-34-00-400-004:

1. Assemble The Tubes And Nozzles In The No. 1.5 Bearing Support Assembly

A. Prerequisites

(1) Assemble the intermediate case. Refer to Assembly-01 Task 72-34-00-400-001.

B. Equipment And Materials Required

Special Tools:
PWA 85199 Fixture
PWA 85251 Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-34-00/17/295

C. Procedure

Subtask 72-34-00-430-078:

(1) Install the support assembly on PWA 85251 Adapter. See Figure 1001.

(a) Install the adapter on PWA 85199 Fixture.

(b) Install the support assembly on the side of the adapter with three clamps.

Subtask 72-34-00-430-059:

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER 1.5 AND 2 BEARING TUBE CONNECTOR. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-179.

(2) Install the No. 1.5 and 2 bearing tube connector assembly (1002/2). See Figure 1002.

(a) Lubricate with Engine Oil P03−001 the threads of four bolts.

(b) Attach the tube connector to the No. 1.5 bearing support assembly (1002/3) with four washers and the four bolts.

(c) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(3) Install the No. 1.5 bearing (oil) nozzle assembly (1002/1).

(a) Install the metering plug in the tube connector (1002/2).

(b) Lubricate with Engine Oil P03−001 the threads of two bolts.

(c) Put the end of the nozzle in the hole of the 1.5 bearing support assembly. Attach the nozzle assembly to the metering plug and the tube connector with two washers and the two bolts.

(d) Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(4) Install the No. 2 bearing (oil) nozzle assembly (1003/1). See Figure 1003.

(a) Install the metering plug in the tube connector (1003/2).

(b) Lubricate with Engine Oil P03−001 the threads of two bolts.

(c) Attach the nozzle assembly to the metering plug and the tube connector with four washers, the two bolts, and two nuts.

(d) Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

CAUTION: BE SURE TO USE THE CORRECT PART NUMBER GEARBOX DRIVE (OIL) PRESSURE TUBE ASSEMBLY. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-179.

(5) Install the gearbox drive (oil) pressure tube assembly (1003/3).

  (a) Install the tube assembly in the gearbox drive (oil) nozzle assembly (1003/4).

  (b) Lubricate with Engine Oil P03-001:

    1 A new packing, if applicable.

    2 The threads of two bolts.

  (c) If applicable, install the packing on the tube assembly.

  (d) Install the tube assembly in the tube connector.

  (e) Attach the nozzle assembly to the 1.5 bearing support assembly with two washers, the two bolts, and two nuts. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(6) Remove the tools from the support assembly.

D. Postrequisites

(1) Flow the No. 1, 1.5, and 2 bearing compartments with oil. Use Testing-01 Task 72-34-00-710-001.

INTERMEDIATE CASE - ASSEMBLY-05

Task 72-34-00-400-005:

1. Assemble The No. 1.5 And 2 Bearing (Carbon) Seal Assembly In The No. 1.5 Bearing Support Assembly

A. Prerequisites

(1) Assemble the tubes and nozzles in the No. 1.5 bearing support assembly. Refer to Assembly-04 (Task 72-34-00-400-004).

B. Equipment And Materials Required

Special Tools:
PWA 85199 Fixture
PWA 85251 Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure

(1) Install the support assembly on PWA 85251 Adapter. See Figure 1001.

(a) Install the adapter on PWA 85199 Fixture.

(b) Install the support assembly on the side of the adapter with three clamps.

(2) Install the No. 1.5 and 2 bearing (carbon) seal assembly (called seal assembly). Refer to Figure 1002.

(a) Apply Engine Oil (P03-001) to the threads of eight bolts.

(b) Attach the seal assembly to the inside of the No. 1.5 bearing support assembly with eight washers and the eight bolts.

(c) Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

Task 72-34-00-710-001:

1. Oil Flow The No. 1, 1.5, And 2 Bearing Compartments

A. Oil Flow Requirement Check

NOTE: You can use this check to find if it is necessary to do the oil flow procedure which follows.

(1) It is not necessary to do an oil flow check of the nozzles if they are examined and there is no damage to the oil nozzles or metering plugs, and there is no coking, contamination or blockage in a nozzle. Examine the parts as follows.

(a) Examine each nozzle before you close the access to the holes.

(b) Examine the nozzles for blockage. Use one of these methods.

1 Use a light to see if there is blockage.

WARNING: BE CAREFUL DURING AN AIRFLOW CHECK. UNWANTED MATERIAL OR OIL BLOWN FROM A NOZZLE CAN CAUSE INJURY TO PERSONNEL.

2 Use air pressure to make sure that there is no blockage.

WARNING: BE CAREFUL DURING AN AIRFLOW CHECK. UNWANTED MATERIAL OR OIL BLOWN FROM A NOZZLE CAN CAUSE INJURY TO PERSONNEL.

(c) Make sure that the module assembly does not have blockage. Supply compressed air to the main bearing pressure manifold assembly. Make sure that there is airflow from each metering hole.

(d) Do the oil flow check of the module assembly if:

1 The airflow step shows blockage in a part.

2 Oil nozzle parts were replaced, interchanged, or repaired.

a You do not have to do an oil flow and spray pattern check for "new" or properly overhauled replacement parts (because they are in the original manufacture limits).

3 A part is from an engine which had an oil system service problem (or one found during the shop visit):

a which caused coking in the oil system tubes.

b which made it necessary to flush the oil system.

c which made it necessary to make sure that the nozzle oil flow and spray pattern are in the limits in the PW4000 Series CIR, PN 51A357.

B. Prerequisites

(1) Assemble the tubes and nozzles in the No. 1.5 bearing support assembly. Refer to Assembly-04 Task 72-34-00-400-004.

C. Equipment And Materials Necessary

Special Tools:

CTE 6050	Stand, Oil Flow
PWA 86224	Fixture, Oil Flow (Optional to PWA 87169)
PWA 87169	Fixture, Oil Flow

Consumable Material:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	1	72-34-00/17/40
Packing	2	72-34-00/17/50
Packing	1	72-34-00/17/235
Packing	1	72-34-00/17/245
Packing	1	79-21-00/11/80

D. Procedure

(1) Apply Engine Oil P03−001 to two bolts. Attach the main bearing tube connector to either PWA 87169 or PWA 86224Fixture with the bolts, two washers, and two nuts. See Figure 1301.

(2) Apply Engine Oil P03−001 to three packings. Install the packings on the main bearing pressure tube assembly. Put the tube assembly through the hole in the fixture.

(3) Attach the No. 1.5 bearing support assembly and the No. 2 bearing and seal assembly to the fixture as follows. See Figure 1302.

  (a) Put the No. 2 bearing and seal assembly on a bench, front end up.

  (b) (Post SB PW4ENG 72−179) Apply Engine Oil P03−001 to two packings. Install the packings on the No. 2 bearing (oil) pressure tube or oil shut−off valve (Post SB PW4ENG 72−394).

  (c) Install the pressure tube in the No. 2 bearing housing at 9 o'clock.

  (d) Align the holes of the detail plate and spacer with the threaded holes of the No. 2 bearing and seal assembly at 9 and 3 o'clock (from the rear), respectively.

  (e) Align the 9 and 3 o'clock holes of the No. 1.5 bearing support assembly with the mating holes in the fixture and the No. 2 bearing and seal assembly.

  (f) Align the holes in the flange of the main bearing pressure tube assembly with the mating holes in the main bearing tube connector assembly.

  (g) Push the main bearing pressure tube assembly in the main bearing tube connector until it touches the bottom.

  (h) Attach the main bearing tube connector assembly, gasket, fixture, and main bearing oil pressure tube together with three washers and three bolts.

(i) Attach the No. 1.5 bearing support assembly, fixture, and No. 2 bearing and seal assembly together with four washers and four bolts.

(4) Apply Engine Oil P03−001 to a packing. Install the packing on the main bearing oil pressure manifold assembly. Attach the manifold assembly to the main bearing tube connector with three bolts. Refer to Figure 1303 for the correct position of the manifold assembly.

(5) Install the No. 1 bearing pressure manifold as follows:

(a) Install the manifold in the main bearing tube connector. Refer to the illustration for the correct position of the manifold assembly.

(b) Attach the manifold to the fixture with two bolts, two washers, and two nuts.

(6) With a hoist, raise the assembly. Put it in a booth. Make the assembly immobile. See Figure 1304.

(7) Put a curved piece of metal under the assembly to catch oil from the No. 2 bearing damper and joints.

(8) Install a tube on each nozzle. During the test, collect oil from each nozzle and from the curved piece of metal under the assembly.

(9) Oil flow procedure:

(a) Attach CTE 6050 Oil Flow Stand to the main bearing oil pressure manifold. Supply oil at 200° − 230°F (93.° − 110.°C) and at 100 psig (689.5 kPa).

(b) Do not take measurements until the oil that leaves the nozzles is at 200°F (93.3°C) minimum. For the damper flow, the oil temperature must be 200°F (93.3°C) at the inlet.

(c) The oil from the nozzles must either go into the open air or to a hose with an inside diameter of 5/8 inch (15.875 mm), minimum. The adapters that connect the hoses to the nozzles must not restrict the flow of oil.

(d) All the nozzles must be flowing in the specified range when the measurements are taken. See Figure 1305.

(10) Remove the stand from the assembly.

NOTE: Do not remove the engine parts from the oil flow fixture if you do the airflow check next.

E. Postrequisites

(1) Do an airflow check of the No. 1, 1.5, and 2 bearing compartments. Refer to Testing−02 Task 72−34−00−720−001.

INTERMEDIATE CASE - TESTING-02

Task 72-34-00-720-001:

1. Airflow The No. 1, 1.5, and 2 Bearing Compartments

A. Equipment and Materials

Special Tools:
CTE 5070 Cart, Airflow (Optional To CTE 6070)
CTE 6070 Cart, Airflow
PWA 85564 Adapter

B. Procedure

See Figure 1301.

NOTE: The engine parts are still installed in the oil flow fixture.

(1) Attach PWA 85564 Adapter to the main bearing oil pressure manifold.

(2) Attach the air supply hose from CTE 6070 or CTE 5070 Airflow Cart to the larger threaded hole of the adapter. Attach the pressure sensing line to the smaller threaded hole in the adapter.

(3) Do an airflow check of the nozzles at 10 psig (68.9 kPa). Write the value of the air flow. Call this value the base rate.

NOTE: The airflow value given for test equipment provision and reference only is 40 - 57 lb/hr (18.14 - 25.85 kg/hr).

(4) Remove the adapter and cart.

(5) Remove from the assembly the engine parts that follow:

(a) Remove the main bearing oil pressure manifold. Discard the packing. Remove the No. 1 bearing pressure manifold.

(b) Remove the No. 1.5 bearing support assembly, the oil flow fixture, and the No. 2 bearing (oil) pressure tube (Pre SB PW4ENG 72-394) or oil shut-off valve (Post SB PW4ENG 72-394) from the No. 2 bearing and seal assembly. Remove the No. 2 bearing (oil) pressure tube/valve from the support assembly. Discard the packings.

INTERMEDIATE CASE - TESTING-02

(c) Remove the main bearing pressure tube assembly from the oil flow fixture. Discard the packings. Remove the main bearing tube connector.

(d) Remove the gasket.

C. Postrequisites

(1) Install the No. 1.5 and 2 bearing (carbon) seal assembly. Refer to Assembly-05 (Task 72-34-00-400-005).

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

NO. 2 BEARING AND SEAL ASSEMBLY - DISASSEMBLY-01

Task 72-34-04-040-001-001:

1. Disassemble No. 2 Bearing And Seal Assembly (Mechanical Wrench)

A. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)
PWA 29389	Pump
PWA 45418	Wrench, Mechanical*
PWA 45419	Multiplier, Pneumatic*
PWA 80071	Multiplier, Torque*
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic*
PWA 85016	Wrench (Optional To PWA 86024)
PWA 85022	Fixture
PWA 85023	Puller
PWA 85026	Drift
PWA 85027	Wrench, Torque*
PWA 85028	Adapter, Holding*
PWA 85199	Fixture
PWA 85251	Adapter
PWA 85375	Plate, Anchor*
PWA 85639	Puller, Jackscrew
PWA 86024	Driver, Hand
PWA 88100	Plate, Anchor*
PWA 104314	Base
PWA 105046	Adapter, Holding*

*See Table 501 for tool options. Only Table 501 shows the correct combinations of tools for the removal of the No. 2 bearing (outer race) retaining nut.

B. Procedure
See Figure 501.

(1) Remove the gearbox drive bevel gear. Use PWA 85023 Hydraulic Puller and PWA 85022 Holding Fixture. See Figure 502.

(a) Install PWA 85023 Puller on PWA 85022 Fixture.

1 Remove the detail nut and washer.

2 Remove the detail hydraulic cylinder.

3 Remove the detail guide ring.

4 Remove the detail pins.

NO. 2 BEARING AND SEAL ASSEMBLY − DISASSEMBLY−01

5 Install PWA 85023 Puller on PWA 85022 Fixture.

(b) Install the No. 2 bearing and seal assembly on PWA 85022 Fixture.

(c) Assemble PWA 85023 Puller.

1 Install the detail guide ring.

2 Install the detail pins in the detail guide ring and through the holes in the gear.

3 Install the detail hydraulic cylinder. Attach it with the detail washer and nut.

(d) Remove the gear.

1 Attach either PWA 3755 Pump or PWA 29389 Hydraulic Pump to the puller.

2 With the pump and puller, remove the gear from the assembly.

(e) Remove the puller.

(2) Remove the spacer.

(3) Remove the top (front) half of the bearing inner race.

(4) Remove the 32 nuts that attach the studs to the No. 2 bearing housing. Use PWA 85199 Fixture, PWA 85251 Adapter and PWA 86024 Driver or PWA 85016 Wrench. See Figure 503.

(a) Remove the No. 2 bearing and seal assembly from PWA 85022 Fixture.

(b) Attach PWA 85199 Fixture to a bench.

(c) Attach PWA 85251 Adapter to PWA 85199 Fixture with the detail bolts.

(d) (Pre SB PW4ENG 72−204) Attach the No. 2 bearing and seal assembly to PWA 85251 Adapter. Put the four detail clamps on four of the tabs at the rear flange of the assembly.

(e) (Post SB PW4ENG 72−204) Attach the No. 2 bearing and seal assembly to PWA 85251 Adapter with the four detail bolts. Attach the assembly to the side with the four clamps.

(f) With PWA 86024 Driver or PWA 85016 Wrench, remove the nuts.

(5) Remove the No. 2 bearing housing assembly from the studs. Use PWA 85639 Jackscrew Puller and PWA 85022 Fixture. See Figure 504.

(a) Install the No. 2 bearing and seal assembly on PWA 85022 Fixture. Install it with the front end up.

(b) Align the dowel pin of the No. 2 bearing (carbon) seal assembly with one of the holes in the detail outer ring. Put the detail outer ring on the seal assembly.

(c) Put each half of the puller under the lip of the No. 2 bearing housing assembly. Attach the two halves to each other with the detail screws.

(d) Turn the jackscrews equally to remove the housing from the studs.

(e) Remove the puller.

(6) Remove the balls and cage from the bearing.

(7) Remove the bottom (rear) half of the inner race and the seal seat from the support assembly.

(8) Remove the outer race retaining nut as follows. See Table 501 for the correct combinations of tools. See Figure 505.

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85027	85028 and 105046	80187	80651 or 45419	88100 or 85375

Matrix Of Tools Used To Remove The No. 2 Bearing (Outer Race) Retaining Nut
Table 501

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85027	85028 and 105046	45418	45419	88100 or 85375
85027	85028 and 105046	80071	80651 or 45419	88100

Matrix Of Tools Used To Remove The No. 2 Bearing (Outer Race) Retaining Nut
Table 501 (Continued)

(a) Install the No. 2 bearing housing assembly and outer race in PWA 104314 Base, the retaining nut up.

(b) Cut the flare and remove the rivet that attaches the nut.

(c) Install the shaft detail of the PWA 105046 Holding Adapter to the center ID of the support base. See Figure 505.

(d) Install PWA 85028 Holding Adapter on the base.

(e) Install the PWA 85027 Torque Wrench over the PWA 85028 Holding Adapter. Engage the wrench in the slots of the retaining nut.

(f) Attach a hoist to the mechanical wrench (or torque multiplier) and install that tool over the adapter.

(g) Install the PWA 88100 or the PWA 85375 Anchor Plate on the mechanical wrench. Engage the pins of the mechanical wrench in the holes of the plate.

(h) Remove the hoist and sling.

(i) Install the nut and plate details of the Holding Adapter (PWA 105046) to seat against the PWA 88100 Anchor Plate.

NO. 2 BEARING AND SEAL ASSEMBLY − DISASSEMBLY−01

(j) If you want to use a pneumatic multiplier, refer to the referenced table. Otherwise, use a standard wrench.

WARNING: INJURY TO PERSONNEL AND/OR DAMAGE TO PARTS AND TOOLS WILL OCCUR IF THE DETAIL NUT (PWA 105046) IS NOT LOOSENED DURING BEARING RETAINER NUT REMOVAL. DURING REMOVAL OF THE BEARING RETAINER NUT, THE DETAIL NUT MUST BE LOOSENED AT EACH 45 DEGREE TURN OF THE BEARING RETAINER NUT TO PREVENT STRESS LOAD ON THE TOOL.

(k) Loosen the detail nut of the Holding Adapter (PWA 105046) at each 45 degree turn of the bearing retaining nut. Loosen the bearing retaining nut to zero lb−in.

(l) Remove the wrenches and adapters.

(m) Remove the bearing retaining nut.

(9) Remove the bearing outer race. Use PWA 85026 Drift. See Figure 506.

(a) Put the No. 2 bearing housing, threads down, on PWA 104314 Base.

(b) With PWA 85026 Drift and an arbor press, remove the outer race.

(c) Remove the housing from the base.

(d) Remove the two seal rings from the housing.

(10) Remove the studs from the No. 2 bearing (carbon) seal assembly. Use PWA 85251 Adapter.

(a) Put the (carbon) seal assembly in the adapter.

(b) With a standard 7/16 inch wrench, remove the 32 nuts that attach the studs to the (carbon) seal assembly.

(c) Remove the two washers that are on each stud.

(d) With an applicable tool, remove the studs from the (carbon) seal assembly.

(e) Remove the (carbon) seal assembly from the tool.

NO. 2 BEARING AND SEAL ASSEMBLY - DISASSEMBLY-02

Task 72-34-04-040-001-002:

1. Disassemble No. 2 Bearing And Seal Assembly (Hydraulic Wrench)

A. Equipment And Materials Necessary

Special Tools:

PWA 3755	Pump (Optional To PWA 29389)
PWA 29389	Pump
PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump, Hydraulic*
PWA 28815	Cart*
PWA 29510	Pump, Hydraulic*
PWA 33732	Wrench, Hydraulic*
PWA 75046	Cart*
PWA 80070	Wrench, Hydraulic*
PWA 85016	Wrench (Optional To PWA 86024)
PWA 85022	Fixture
PWA 85023	Puller
PWA 85026	Drift
PWA 85027	Wrench, Torque*
PWA 85028	Adapter, Holding*
PWA 85199	Fixture
PWA 85251	Adapter
PWA 85370	Wrench, Torque*
PWA 85371	Adapter, Holding*
PWA 85639	Puller, Jackscrew
PWA 86024	Driver, Hand
PWA 87354	Wrench, Hydraulic*
PWA 88100	Plate, Anchor*
PWA 104314	Base
PWA 104437	Adapter, Holding

*See Table 501 for tool options. Only Table 501 shows the correct combinations of tools for the removal of the No. 2 bearing (outer race) retaining nut.

B. Procedure
See Figure 501.

(1) Remove the gearbox drive bevel gear. Use PWA 85023 Hydraulic Puller and PWA 85022 Holding Fixture. See Figure 502.

(a) Install PWA 85023 Puller on PWA 85022 Fixture.

1 Remove the detail nut and washer.

2 Remove the detail hydraulic cylinder.

NO. 2 BEARING AND SEAL ASSEMBLY − DISASSEMBLY−02

3 Remove the detail guide ring.

4 Remove the detail pins.

5 Install PWA 85023 Puller on PWA 85022 Fixture.

(b) Install the No. 2 bearing and seal assembly on PWA 85022 Fixture.

(c) Assemble PWA 85023 Puller.

1 Install the detail guide ring.

2 Install the detail pins in the detail guide ring and through the holes in the gear.

3 Install the detail hydraulic cylinder. Attach it with the detail washer and nut.

(d) Remove the gear.

1 Attach either PWA 3755 Pump or PWA 29389 Hydraulic Pump to the puller.

2 With the pump and puller, remove the gear from the assembly.

(e) Remove the puller.

(2) Remove the spacer.

(3) Remove the top (front) half of the bearing inner race.

(4) Remove the 32 nuts that attach the studs to the No. 2 bearing housing. Use PWA 85199 Fixture, PWA 85251 Adapter, and PWA 86024 Driver or PWA 85016 Wrench. See Figure 503.

(a) Remove the No. 2 bearing and seal assembly from PWA 85022 Fixture.

(b) Attach PWA 85199 Fixture to a bench.

(c) Attach PWA 85251 Adapter to PWA 85199 Fixture with the detail bolts.

NO. 2 BEARING AND SEAL ASSEMBLY − DISASSEMBLY−02

(d) (Pre SB PW4ENG 72−204) Attach the No. 2 bearing and seal assembly to PWA 85251 Adapter. Put the four detail clamps on four of the tabs at the rear flange of the assembly.

(e) (Post SB PW4ENG 72−204) Attach the No. 2 bearing and seal assembly to PWA 85251 Adapter with the four detail bolts. Attach the assembly to the side with the four clamps.

(f) With PWA 86024 Driver or PWA 85016 Wrench, remove the nuts.

(5) Remove the No. 2 bearing housing assembly from the studs. Use PWA 85639 Jackscrew Puller and PWA 85022 Fixture. See Figure 504.

(a) Install the No. 2 bearing and seal assembly on PWA 85022 Fixture. Install it with the front end up.

(b) Align the dowel pin of the No. 2 bearing (carbon) seal assembly with one of the holes in the detail outer ring. Put the detail outer ring on the seal assembly.

(c) Put each half of the puller under the lip of the No. 2 bearing housing assembly. Attach the two halves to each other with the detail screws.

(d) Turn the jackscrews equally to remove the housing from the studs.

(e) Remove the puller.

(6) Remove the balls and cage from the bearing.

(7) Remove the bottom (rear) half of the inner race and the seal seat from the support assembly.

(8) Remove the outer race retaining nut. See Table 501 for the correct combinations of tools. Refer to Figure 505.

NO. 2 BEARING AND SEAL ASSEMBLY - DISASSEMBLY-02

PWA Torque Wrench	PWA Holding Adapter	PWA Hydraulic Wrench	PWA Anchor Plate	PWA Pump	PWA Cart
85370	85371	33732	-----	28814 or 29510	75046
85370	85371	18872	-----	28814 or 29510	75046 or 28815
85027	85028	87354	88100	28814 or 29510	75046
85027	85028	80070	88100	28814 or 29510	75046

Matrix Of Tools Used To Remove The No. 2 Bearing (Outer Race) Retaining Nut
Table 501

(a) Install the No. 2 bearing housing assembly and outer race in PWA 104314 Base, the retaining nut up.

(b) Cut the flare and remove the rivet that attaches the nut to the bearing housing assembly.

(c) (Method 1)

1 Install the shaft detail of the PWA 104437 Holding Adapter to the center ID of the support base.

2 Install PWA 85370 Torque Wrench on the nut. Engage the teeth of the wrench in the slots of the nut.

3 Install the nut and washer details of the Holding Adapter (PWA 104437) to seat against the top of the Torque Wrench (PWA 85370).

4 Install PWA 85371 Adapter on the torque wrench. Engage the detail pins of the base in the holes of the outer ring of the adapter.

5 With a hoist, remove a hydraulic wrench from a cart.

6 Put the hydraulic wrench on the adapter.

7 Connect a pump to the hydraulic wrench.

8 Loosen and remove the nut.

(d) (Method 2)

1 Install PWA 85028 Adapter in the base. Engage the slots in the adapter with the lugs in the base.

2 Install PWA 85027Torque Wrench over the adapter. Engage the teeth of the wrench with the slots of the nut.

3 With a hoist, remove a hydraulic wrench from from a cart. Install the hydraulic wrench on the torque wrench.

4 Install PWA 88100 Anchor Plate on the adapter, splines aligned. Engage the pins on the hydraulic wrench with the holes in the anchor plate.

5 Connect a pump to the hydraulic wrench.

6 Loosen and remove the nut.

(e) Remove the wrenches, pump, and adapters.

(9) Remove the bearing outer race. Use PWA 85026 Drift. See Figure 506.

(a) Put the No. 2 bearing housing, threads down, on PWA 104314 Base.

(b) With PWA 85026 Drift and an arbor press, remove the outer race.

(c) Remove the housing from the base.

(d) Remove the two seal rings from the housing.

(10) Remove the studs from the No. 2 bearing (carbon) seal assembly. Use PWA 85251 Adapter.

(a) Put the (carbon) seal assembly in the adapter.

(b) With a standard 7/16 inch wrench, remove the 32 nuts that attach the studs to the (carbon) seal assembly.

(c) Remove the two washers that are on each stud.

(d) With an applicable tool, remove the studs from the (carbon) seal assembly.

(e) Remove the (carbon) seal assembly from the tool.

NO. 2 BEARING AND SEAL ASSEMBLY - ASSEMBLY-01

Task 72-34-04-440-001-001:

1. Assemble No. 2 Bearing Outer Race And Housing Assembly (Mechanical Wrench)

A. Equipment And Materials Necessary

Special Tools:

PWA 45418	Wrench, Mechanical*
PWA 45419	Multiplier, Pneumatic*
PWA 80071	Multiplier, Torque*
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic*
PWA 85026	Drift
PWA 85027	Wrench, Torque*
PWA 85028	Adapter, Holding*
PWA 85375	Plate, Anchor*
PWA 85901	Riveter
PWA 88100	Plate, Anchor*
PWA 104314	Base
PWA 105046	Adapter, Holding*

*See Table 1001 for tool options. Only Table 1001 shows the correct combinations of tools for the installation of the No. 2 bearing (outer race) retaining nut.

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	1	72-34-00/15/40

B. Procedure

(1) Install housing into PWA 104314 Base, threaded end up. Install No. 2 bearing outer race into housing with "FRONT", marked on bearing race, down. Seat outer race using PWA 85026 Drift. See Figure 1001.

CAUTION: A NEW OR REFURBISHED NO. 2 BEARING (OUTER RACE) RETAINING NUT MUST BE INSTALLED OR DAMAGE TO ENGINE PARTS MAY OCCUR. NUT MAY BE REFURBISHED PER 72-34-11, REPAIR-01 TASK 72-34-11-300-001.

(2) Install the outer race retaining nut as follows. Refer to Table 1001 for the correct combinations of tools. Refer to Figure 1002.

NO. 2 BEARING AND SEAL ASSEMBLY - ASSEMBLY-01

PWA Torque Wrench	PWA Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Anchor Plate
85027	85028 and 105046	80187	80651 or 45419	88100 or 85375
85027	85028 and 105046	45418	45419	88100 or 85375
85027	85028 and 105046	80071	80651 or 45419	88100

Matrix Of Tools Used To Install The
No. 2 Bearing (Outer Race) Retaining Nut
Table 1001

(a) Install the tools. See Figure 1002.

1 Install the shaft detail of the PWA 105046 Holding Adapterto the center ID of the PWA 104314 Supprot Base with cap screws.

2 Install PWA 85028 Adapter in the base. Engage the slots in the adapter with the lugs in the base.

3 Install PWA 85027 Torque Wrench over the adapter. Engage the teeth of the wrench with the slots of the nut.

4 Attach a hoist to the mechanical wrench (or torque multiplier) and install that tool over the adapter.

5 Install the PWA 88100 or the PWA 85375 Anchor Plate on the mechanical wrench. Engage the pins of the mechanical wrench in the holes of the plate.

6 Remove the hoist and sling.

7 Install the nut and plate details of the Holding Adapter (PWA 105046) to seat against the PWA 88100 Anchor Plate.

8 If you want to use a pneumatic multiplier, refer to the referenced table. Otherwise, use a standard wrench.

(3) (Reference 253) Torque nut as follows:

(a) Tighten nut to 2200 - 2800 lb-in. (248.567 - 316.357 N.m).

NOTE: If the bearing retaining nut is installed with holding adapter (PWA 105046) the detail nut must be tightened each 45 degrees of bearing retaining nut rotation to keep the torque wrench teeth engaged with the bearing retaining nut.

(b) Establish common reference points between nut and its mating part.

(c) Turn nut through angle of 2 - 3.5 degrees.

(d) Loosen nut to zero and repeat step (a).

(e) If the nut reference point is in line with the mating part reference point or beyond it within 0 degrees 30 minutes maximum, apply final angle of turn per step (g).

(f) If the reference points are not within limits, repeat step (b), (c) and (d) in order until reference points are within limits. Then perform step (e).

(g) Turn the nut through an angle of 44 - 47 degrees.

(h) Visually examine the No. 2 bearing outer race and housing assembly shoulder to make sure it is seated. Make sure the gap is less than 0.001 inch (0.025 mm).

NOTE: A slight 0.002 - 0.003 inch (0.051 - 0.076 mm) rolling of the nut in relation to the rear face of the outer race is acceptable.

(4) Secure nut to outer race housing with rivet (head toward ID). Flare rivet with PWA 85901 Riveter.

C. Postrequisites

Matrix Of Tools Used To Remove The No. 2 Bearing (Outer Race) Retaining Nut
Table 501

(a) Install the nut on the No. 2 bearing support assembly. Tighten it with your fingers.

(b) (Method 1)

1 Install the shaft detail of the PWA 104437 Holding Adapter to the center ID of the support base.

2 Install PWA 85370 Torque Wrench on the nut. Engage the teeth of the wrench in the slots of the nut.

3 Install the nut and washer details of the Holding Adapter (PWA 104437) to seat against the top of the Torque Wrench (PWA 85370).

4 Install PWA 85371 Adapter on the torque wrench. Engage the detail pins of the base in the holes of the outer ring of the adapter.

5 With a hoist, remove a hydraulic wrench from a cart.

6 Put the hydraulic wrench on the adapter.

7 Connect a pump to the hydraulic wrench.

(c) (Method 2)

1 Install PWA 85028 Adapter in the base. Engage the slots in the adapter with the lugs in the base.

2 Install PWA 85027 Torque Wrench over the adapter. Engage the teeth of the wrench with the slots of the nut.

3 With a hoist, remove a hydraulic wrench from from a cart. Install the hydraulic wrench on the torque wrench.

4 Install PWA 88100 Anchor Plate on the adapter, splines aligned. Engage the pins on the hydraulic wrench with the holes in the anchor plate.

5 Connect a pump to the hydraulic wrench.

(d) Remove the wrenches, pump, and adapter.

(3) (Reference 253) Torque nut as follows:

(a) Tighten nut to 2200 - 2800 lb-in. (248.567 - 316.357 N.m).

(b) Establish common reference points between nut and its mating part.

(c) Turn nut through angle of 2 - 3.5 degrees.

(d) Loosen nut to zero and repeat step (a).

(e) If the nut reference point is in line with the mating part reference point or beyond it within 0 degrees 30 minutes maximum, apply final angle of turn per step (g).

(f) If the reference points are not within limits, repeat step (b), (c) and (d) in order until reference points are within limits. Then perform step (e).

(g) Turn the nut through an angle of 44 − 47 degrees.

(h) Visually examine the No. 2 bearing outer race and housing assembly shoulder to make sure it is seated. Make sure the gap is less than 0.001 inch (0.025 mm).

R R R NOTE: A slight 0.002 − 0.003 inch (0.051 − 0.076 mm) rolling of the nut in relation to the rear face of the outer race is acceptable.

(i) Remove the wrenches, pump, and adapters.

(4) Secure nut to outer race housing with rivet (head toward ID). Flare rivet with PWA 85901 Riveter.

Install The No. 2 Bearing (Outer Race) Retaining Nut (Method 2)
Figure 1002 (Sheet 2)
(Task 72-34-04-440-001-002)

NO. 2 BEARING AND SEAL ASSEMBLY - ASSEMBLY-03

Task 72-34-04-440-002:

1. Final Assemble The No. 2 Bearing And Seal Assembly

A. Prerequisites

(1) Assemble the No. 2 bearing outer race and housing assembly. See 72-34-04, Assembly-01 (Task 72-34-04-440-001-001) or 72-34-04, Assembly-02 (Task 72-34-04-440-001-002).

B. Equipment And Materials Necessary

Special Tools:

PWA 3755	Hydraulic Pump (Optional To PWA 29389)
PWA 29389	Hydraulic Pump
PWA 75028	Gage
PWA 85005	Fixture, Loading
PWA 85014	Cover
PWA 85016	Wrench (Optional To PWA 86024)
PWA 85017	Adapter, Retaining
PWA 85018	Pusher
PWA 85019	Base, Supporting
PWA 85020	Drift
PWA 85199	Fixture
PWA 85251	Adapter, Holding
PWA 86024	Driver, Hand

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-232	Marker (PMC 4058-6)
P06-001	Lubricant, Dry Film (PMC 9934)
R P06-054	Paste, Antiseize (PWA 36246)
P11-014	Alcohol, Isopropyl (PMC 9094)

C. Procedure

NOTE: Refer to Standard Practices Manual, PN 585005, for instructions on how to touch bearings.

(1) Attach PWA 85199 Fixture to a bench. Align the keyway in the arm of PWA 85251 Holding Adapter with the key in the fixture. Attach the adapter to the fixture with the detail bolts. See Figure 1001.

(2) Attach the No. 2 bearing support assembly (called support) to the side of the adapter with the four clamps.

NOTE: The dowel pin on the OD flange of the support must be aligned with one of the two cutouts in the adapter.

(a) (Pre SB PW4ENG 72-204) Align the four clamps with four of the tabs on the rear flange of the assembly. Tighten the four clamps.

(b) (Post SB PW4ENG 72-204) Align the four tapped holes in the assembly with the bolt holes in the adapter. Attach the assembly to the adapter with the four detail bolts.

(3) (Reference 140) Install the No. 2 bearing housing assembly (called housing) in the support as follows. See Figure 1002.

R (a) Apply Antiseize Paste P06-054 to the threads at
R each end of 32 studs. Wipe off unwanted paste.

(b) Install the 32 studs in the support, with the flats of the studs through the support.

NOTE: The studs will be fully installed in the support when you tighten the hex nuts.

(c) Install the thick key washers on the rear end of the studs. Install the hex nuts over the key washers. Tighten the hex nuts to seat the key washers. Remove the nuts.

(d) Install the thin key washers on the rear end of the studs to touch the thick key washers. Install the hex nuts. Tighten the hex nuts to seat the key washers.

(e) (Reference 126) Measure the end gap clearance for the No. 2 bearing housing seal rings. Install the seal rings in bearing housing with an ID of 12.240 inches (310.896 mm). See Figure 1002 for Pre SB PW4ENG 72-179 and Post SB PW4ENG 72-179 correct measurement.

(f) (Reference 125) Find the side clearance between the seal rings and the housing.

(g) Apply Engine Oil P03−001 to two seal rings. Install the seal rings in the grooves of the housing. Put the cutouts in the rings at the pins that are in the grooves of the housing.

(h) Install the housing, nut down, over the front end of the 32 studs. With the dowel pin in the support at 6 o'clock, the cutouts in the seal rings of the housing must be either on the vertical centerline or on the 3 o'clock position opposite to the oil inlet as seen from the rear of the engine. Do not fully install the housing at this time.

NOTE: It is thought a "best practice" to assemble the damper assembly such that the piston ring stops are not aligned with the oil supply line. When the piston ring stops are 180 degrees away from the oil supply, the oil must flow all the way around the bearing before it goes by the bearing at the piston ring stops.

NOTE: The studs will be fully installed in the housing when you tighten the locknuts.

(i) Install four locknuts, at equal distances from each other, on the front end of the studs. Tighten the locknuts past the locking feature but not more than 50 lb−in. (5.649 N.m) torque, maximum.

NOTE: Optional non−silver plated locknuts have been introduced by SPN P3013 for this assembly in order to reduce the potential for stress corrosion between the titanium studs (tierods) and the silver plated nuts. Stress corrosion can result when the silver
R plating comes in contact with the Antiseize
R Paste P06−054 which is added to the threads of the studs in step C.3.(a) above.

(j) Turn the assembly so that the hex nuts and key washers are face up. Before you torque the hex nuts, make sure that the seal rings of the housing are engaged in the grooves of the housing.

(k) Torque the hex nuts to 425 - 475 lb-in. (48.019 - 53.668 N.m). While you torque the hex nuts, put a wrench on the flats of the stud head on the opposite end to stop stud rotation and press the tabs of the thick key washers toward the center of the assembly. Refer to Standard Practices Manual, PN 585005, for key washer acceptance standards.

NOTE: If necessary, keep the tab of the thin key washer in position with an open end wrench while you torque the nuts.

(l) Bend the four keys of the thin key washers against the hex nuts. Refer to Standard Practices Manual, PN 585005, for key washer acceptance standards.

(m) Remove the support assembly from the adapter.

(4) Install the seal seat, rear inner race, and balls and cage as follows. See Figure 1003.

(a) Put the support assembly on PWA 85018 Pusher, dowel pin up.

1 (Post SB PW4ENG 72-204) The pusher must be Change Letter D. Engage the four detail dowel pins.

2 For reasons of alignment, put a mark on the conical surface of the housing. This mark should be aligned with the word "front" marked on the bearing outer race. Use Marker P05-232.

CAUTION: BE VERY CAREFUL NOT TO DAMAGE THE CARBON SEAL WHEN YOU INSTALL THE SEAL SEAT.

(b) Install the seal seat as follows.

NOTE: It is permitted to apply Engine Oil P03-001 to the sealing face of the seal seat. This is the surface that is outboard of the word "rear".

NOTE: It is permitted to apply Engine Oil P03-001 to the upper face of the carbon seal.

1 For reasons of alignment, put a mark on the seal seat in line with the word "rear". Use Marker P05-232.

2 With the marks on the seal seat and the housing aligned, very carefully install the seal seat, "rear" down, on the carbon seal.

3 Remove the mark from the seal seat.

(c) Install the rear inner race as follows.

1 For reasons of alignment, put a mark on the rear inner race in line with the "X". Use Marker P05−232.

2 With the marks on inner race and the housing aligned, very carefully install the inner race, curved side up.

3 Remove the mark from the inner race.

(d) Install the detail retainer over the center rod of the pusher. Install the detail washer and eye bolt. Tighten the eye bolt to compress the spring of the carbon seal assembly.

(e) Remove the four locknuts installed on the studs. Lift up the housing sufficiently to permit the balls and cage to drop into position. Install the balls and cage, serial number down, in the bearing outer race, which is installed in the the housing.

(f) Lower the bearing housing into the support. Be sure that the seal rings are engaged in the support. If it is necessary, use a nylon rod to engage the seal rings in the support. Re−install the four locknuts.

(5) (Reference 140) Assemble the No. 2 bearing assembly as follows.

(a) Install 28 additional (Post SPN P3013) locknuts on the studs. Tighten all 32 locknuts past the locking feature of the nuts, but not more than 50 lb−in. (5.649 N.m).

(b) Install PWA 85014 Cover on the assembly.

(c) While you hold the flats of the studs with PWA 86024 Driver or PWA 85016 Wrench, tighten and torque the locknuts to 450 − 500 lb−in. (50.843 − 56.492 N.m). Obey the torque sequence on the tool cover.

(d) Do a check of the seating at both ends of the 32 studs, between the shoulders of the studs and the adjacent surfaces of the support and housing, with a 0.001 inch (0.025 mm) feeler gage. The feeler gage must not fit between these surfaces.

(6) Remove the support assembly from the pusher. Install the support assembly in the holding adapter. Install it on the side with the four clamps. The dowel pin on the OD flange of the support assembly must be aligned with one of the two cutouts on the adapter.

(7) Install the front inner race as follows.

(a) For reasons of alignment, put a mark on the front inner race surface opposite the the "X." Use Marker P05−232.

(b) With the marks on inner race and the housing aligned, install the inner race, curved surface down.

(c) Remove the mark from the inner race.

(8) Attach the loading fixture and retaining adapter to the support assembly as follows. See Figure 1004.

(a) Install the detail force gage of PWA 85005 Loading Fixture to the lug on PWA 85017 Retaining Adapter. Use the detail ball lock pins.

(b) Very carefully install the detail locator, rod up, through the center of the seal assembly. The lip of the locator must touch the rear of the seal seat.

(c) Install the detail bung on the rod. The cutouts in the bung must not be aligned with the dowel pin in the OD flange of the support.

(d) Install the detail nut. Tighten the nut to bring the bearing inner races more closely together.

(e) Turn the holding adapter so that the dowel pin of the support is at 6 o'clock (in flight position).

(f) Install the loading fixture on the support assembly as follows.

1 Put the detail feet of the loading fixture in the cutouts of the holding adapter.

2 (Pre SB PW4ENG 72-204) Align a tab on the rear flange of the support with a slot in the detail feet of the fixture. Turn the fixture to mis-align the tabs of the support and the slots of the fixture. Tighten the four detail clamps on the fixture.

3 (Post SB PW4ENG 72-204) Align the holes in the detail feet with the threaded holes in the support assembly. Attach the feet to the support assembly with detail screws. Tighten the screws.

(9) (Reference 204) Find the necessary spacer thickness (Dimension Z) as follows.

(a) Turn the detail bolt on the loading fixture until it touches the ball on the force gage. Tighten the bolt against the ball until the reading on the gage is 80 - 120 lbf. (355.9 - 533.8 N). Loosen the bolt until the gage shows 0 lbs (0.00 kg). Tighten the bolt again until the gage shows 80 - 120 lbf. (355.9 - 533.8 N).

(b) Measure the distance from the front face of the bearing inner race to the face of the threaded flange of the support assembly. Take this measurement at four positions. Find the average of the four measurements. Write this average and call it Dimension A.

(c) Measure the thickness of the rear flange at the ID of the intermediate case. Call this Dimension B.

NOTE: Take an average of four readings for Dimension B.

(d) Subtract Dimension B from Dimension A. Call this Dimension X.

(e) Add 3.9380 inches (100.025 mm) to Dimension X. Subtract this total from Dimension M.

NOTE: Refer to 72-34-00, Assembly-02 Task 72-34-00-400-002 for Dimension M.

(f) Write the result as Dimension Z. Dimension Z ± 0.001 inch (0.025 mm) is the necessary thickness of the classified spacer for the assembly.

(g) Choose the correct classified spacer. Refer to Table 1001. The faces of the spacer must be parallel within 0.0002 inch (0.0051 mm).

CLASS	DIMENSION - INCH (mm)
1	0.151 - 0.152 (3.836 - 3.860)
2	OVER 0.152 - 0.153 (3.861 - 3.886)
3	OVER 0.153 - 0.154 (3.887 - 3.911)
4	OVER 0.154 - 0.155 (3.912 - 3.937)
5	OVER 0.155 - 0.156 (3.937 - 3.962)
6	OVER 0.156 - 0.157 (3.963 - 3.987)
7	OVER 0.157 - 0.158 (3.988 - 4.013)
8	OVER 0.158 - 0.159 (4.014 - 4.038)
9	OVER 0.159 - 0.160 (4.039 - 4.064)
10	OVER 0.160 - 0.161 (4.064 - 4.089)
11	OVER 0.161 - 0.162 (4.090 - 4.114)
12	OVER 0.162 - 0.163 (4.115 - 4.140)
13	OVER 0.163 - 0.164 (4.141 - 4.165)
14	OVER 0.164 - 0.165 (4.166 - 4.191)
15	OVER 0.165 - 0.166 (4.191 - 4.216)
16	OVER 0.166 - 0.167 (4.217 - 4.241)
17	OVER 0.167 - 0.168 (4.242 - 4.267)
18	OVER 0.168 - 0.169 (4.268 - 4.292)
19	OVER 0.169 - 0.170 (4.293 - 4.318)
20	OVER 0.170 - 0.171 (4.318 - 4.343)
21	OVER 0.171 - 0.172 (4.344 - 4.368)
22	OVER 0.172 - 0.173 (4.369 - 4.394)
23	OVER 0.173 - 0.174 (4.395 - 4.419)
24	OVER 0.174 - 0.175 (4.420 - 4.445)
25	OVER 0.175 - 0.176 (4.445 - 4.470)
26	OVER 0.176 - 0.177 (4.471 - 4.495)
27	OVER 0.177 - 0.178 (4.496 - 4.521)
28	OVER 0.178 - 0.179 (4.522 - 4.546)

Spacer Classification
Table 1001

R
R

NO. 2 BEARING AND SEAL ASSEMBLY − ASSEMBLY−03

(h) Loosen the detail force gage. Remove the loading fixture.

(i) Turn the holding adapter so the dowel pin in the support is face up. Remove the retaining adapter.

(10) (Reference 2201) Remove the front inner race from the assembly. Heat the inner race per Standard Practices Manual, PN 585005. Do not attach thermocouples to the inner race with tack welds.

(11) Remove the assembly from the adapter. Install the assembly on PWA 85018 Pusher.

(12) Assemble the gearbox drive bevel gear as follows. See Figure 1005.

NOTE: It is permitted to apply a thin layer of Lubricant P06−001 on the bearing journal of the gear. Remove any overspray from the shoulder of the gear with Alcohol P11−014 and lint−free cloth.

(a) Put the gearbox drive bevel gear, gear end down, on PWA 85019 Base. Install the classified spacer on the gear.

(b) Remove the front inner race from the heat source. Install the inner race, step down, on the gear.

(c) Seat the front inner race on the gear with PWA 85020 Drift and an arbor press. Keep the load on the drift for approximately 30 seconds. Remove the drift.

(d) With a 0.001 inch (0.025 mm) feeler gage, do a check of the seating of the front inner race.

(13) Install the gear assembly in the support assembly as follows. See Figure 1006.

(a) Install the detail press plate of the pusher in the gear assembly. Tighten the four detail clamps.

NO. 2 BEARING AND SEAL ASSEMBLY − ASSEMBLY−03

CAUTION: (Reference 2201) THE TEMPERATURE OF THE INNER RACE MUST BE NO MORE THAN 50°F (28°C) ABOVE THE TEMPERATURE OF THE OUTER RACE.

(b) Install the gear assembly over the rod of the pusher and into the support assembly. Remove the mark on the housing.

(c) Connect the hose from the PWA 3755 Pump or PWA 29389 Pump to the detail hydraulic cylinder. Install the hydraulic cylinder over the detail rod.

(d) Install the detail washer and eye bolt.

(e) (Reference 2201) With the pump and PWA 75028 Gage, put a 5800 psi (39989.6 kPa) load on the assembly. The tool must touch both ends of the assembly for 360 degrees. Permit the heated details to cool to room temperature. There must be zero clearance between all mating surfaces at all times.

(f) (Reference 2201) Reduce the load to 0 psi (0.0 kPa).

(g) (Reference 2201) Measure Dimension CC in three equally spaced positions. Write the average of these measurements. See Figure 1007.

NOTE: The temperature of all parts must be within 0° − 5°F (0° − 2.75°C) of room temperature when you take the measurements.

(h) Remove the tools.

(14) Wrap the assembly in a cover that prevents contamination.

NO. 2 BEARING (CARBON) SEAL ASSEMBLY − DISASSEMBLY−01

Task 72−34−05−040−001:

1. Disassemble No. 2 Bearing (Carbon) Seal Assembly

   A. Equipment And Materials Required − None

   B. Procedure

   See Figure 501.

   (1) Place No. 2 bearing seal assembly on workbench with dowel pin up.

   (2) Retain No. 2 bearing seal face against spring pressure. Remove cotter pins and retaining collars from seal support pins.

   (3) Remove No. 2 seal face from assembly.

   (4) Remove seal ring from groove of No. 2 seal face.

      (a) (Seal assemblies with a non−metallic seal ring) Discard the seal ring.

   (5) Remove springs from seal support.

   (6) Remove spacers from two pins from support pins.

NO. 2 BEARING (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

Task 72-34-05-440-001:

1. Assemble No. 2 Bearing (Carbon) Seal Assembly

A. Equipment And Materials Required

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	4	72-34-00/16/110
Seal Ring*	1	72-34-00/16/120A
Seal Ring*	1	72-34-00/16/120B

NOTE: *These seal rings are not applicable to PN 50G415, 51G083, or 51G249 seal assemblies. Those part numbers use piston rings. Piston rings are not expendable items.

B. Procedure
See Figure 1001.

(1) Place No. 2 bearing (carbon) seal support assembly on workbench, dowel pin up.

(2) Install two spacers over opposite pins as noted in referenced figure.

(3) Install 12 springs over pins in support.

(4) Install seal/piston ring in groove of No. 2 bearing seal face and install seal face over pins and springs.

(a) (Seal assemblies with piston rings) Be sure gap in seal ring is installed per referenced figure.

(5) Retain seal assembly against springs and install four collars and secure with four cotter pins. See 70-53, Standard Practices Manual, PN 585005.

C. Postrequisites

(1) Airflow check No. 2 bearing (carbon) seal assembly per Testing-01 Task 72-34-05-720-001.

1. (Seal Assemblies With Piston Rings) 0.500 Inch (12.700 mm) Maximum
2. (Seal Assemblies With Piston Rings) (Reference 136) 0.030 − 0.040 Inch (0.76 − 1.02 mm) When Installed In A Ring Gage With An ID Of 8.930 Inches (226.822 mm). 0.027 − 0.043 Inch (0.69 − 1.09 mm) When Installed In A No. 2 Bearing Support Assembly With An 8.929 − 8.931 Inch (226.797 − 226.847 mm) ID. The Gap In The Seal Ring Must Be In Area F.
3. (Seal Assemblies With Piston Rings) (Reference 135) Side Clearance 0.003 − 0.009 Inch (0.077 − 0.228 mm).

Key to Figure 1001 (Sheet 2)

NO. 2 BEARING (CARBON) SEAL ASSEMBLY - TESTING-01

Task 72-34-05-720-001:

1. Airflow Check - No. 2 Bearing (Carbon) Seal Assembly

A. Prerequisites

(1) Assemble the No. 2 bearing (carbon) seal assembly. Refer to Assembly-01 (Task 72-34-05-440-001).

B. Equipment And Materials Required

Special Tools:

PWA 6507	Flowmeter, Leak Test (with PWA 45411 Gage, optional to PWA 46400 Gage)
PWA 45411	Gage, Differential Pressure (with PWA 6507 Flowmeter, optional to PWA 46400 Gage)
PWA 46400	Gage, Measurement - Airflow and Differential Pressure Oil Seal Assemblies
PWA 85118	Fixture, Leak Test

C. Procedure

See Figures 1301 and 1302.

NOTE; It is possible to use the fixture with the 5th stage HPC shroud retaining ring attached to the seal assembly.

(1) Install three lifting eyes in the detail cover of PWA 85118 Leak Test Fixture. Remove the detail cover. Inspect the micro finished surfaces of the detail ring assembly for nicks and scratches. Repair as necessary. Put the detail ring assembly, micro finished surface up, in the fixture.

NOTE: It is permitted to use the No. 2 bearing seal seat instead of the detail ring assembly.

(2) Carefully put the seal assembly in the fixture base.

(3) Install the fixture cover. Attach the cover to the base at the center with the detail washer and large hex nut. Attach the cover to the base at the perimeter with 16 detail washers and hex nuts.

(4) For operators who use PWA 6507 Flowmeter and PWA 45411 Gage, connect the flowmeter and the gage to the fixture:

(a) Connect the hose from the flowmeter to the fitting marked FLOWMETER on the base of the fixture.

Figure 1302
(Task 72-34-05-720-001)

(b) Remove the quick−disconnect socket plugs from the fittings marked DELTA−P SEALS and INLET SEALS. Install these plugs in the fittings marked DELTA−P PINS and INLET PINS.

(c) Attach the larger quick−disconnect fitting of the gage to the DELTA−P SEALS fitting on the fixture base.

(d) Attach the air inlet hose to the fitting marked INLET SEALS.

(e) Attach the smaller quick−disconnect fitting of the gage to the fitting marked DELTA−P.

(5) For operators who use PWA 46400 Measurement Gage, connect the gage to the fixture:

(a) Install the gage hose marked RETURN on the fitting on the fixture base marked FLOWMETER.

(b) Remove the quick−disconnect socket plugs from the fittings marked DELTA−P SEALS and INLET SEALS. Install these plugs in the fittings marked DELTA−P PINS and INLET PINS.

(c) Install the gage hose marked D.P. HI. on the fitting on the fixture cover marked DELTA−P SEALS.

(d) Install the gage hose marked D.P. LO. on the fitting on the fixture base marked DELTA−P.

(e) Install the gage hose marked SUPPLY on the fitting on the fixture cover marked INLET SEALS.

(6) Do the air flow check for total air leakage:

(a) Supply regulated, filtered air to the fixture.

(b) For seal assemblies PNs 50G415, 51G083, and 51G249, leakage of air must not be more than 3.0 cu ft/min (0.08 cu m/min) with an 80 psi (551.6 kPa) pressure drop.

(c) For other part number seal assemblies, the leakage of air must not be more than 0.5 cu ft/min (0.01 cu m/min) with a 40 psi (275.8 kPa) pressure drop.

(7) If the seal assembly is not inside the limits, it is necessary to do a check of the leakage at the piston/seal ring:

(a) Remove the fixture cover.

(b) Remove the seal assembly.

(c) Remove the detail ring assembly.

(d) Install the ring assembly in the fixture, rubber side up.

(e) Install the seal assembly, if applicable the adapter, and the cover.

(f) Do another air flow check. This value is the leakage at the seal/piston ring.

1 Subtract this value from the total leakage value. The result is the leakage at the carbon element.

D. Postrequisites

(1) If there is leakage at the carbon element, lap the carbon element. Refer to the CIR Manual, 72-34-07, Repair-01 (Task 72-34-01-300-001).

(2) If the leakage is not within limits and not at the carbon element, replace the seal/piston ring. Refer to Diassembly-01 (Task 72-34-05-040-001) and Assembly-01 (Task 72-34-05-440-001).

NO. 2 BEARING SUPPORT ASSEMBLY − TESTING−01

Task 72−34−06−720−001:

1. Airflow Check − No. 2 Bearing Support Assembly

This Procedure Has Been Relocated To Inspection/Check−05

Previous Pageblock Return to Previous Menu Next Pageblock

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY - DISASSEMBLY-01

Task 72-34-35-040-001:

1. Disassemble No. 1.5 And 2 Bearing (Carbon) Seal Assembly

   A. Equipment And Materials Required - None

   B. Procedure

      See Figure 501.

      (1) Place No. 1.5 and 2 bearing seal assembly on workbench with rear face down (resting on pins).

      (2) Retain No. 1.5 seal face against spring pressure. Remove cotter pins and retaining collars from seal support pins.

      (3) Remove No. 1.5 seal face from assembly.

      (4) Remove seal ring from groove of No. 1.5 seal face.

      (5) Remove springs from No. 2 seal face.

      (6) Remove two spacers from support assembly and invert No. 2 seal face, support assemblies down.

      (7) Remove cotter pins and retaining collars from pins on supports.

      (8) Remove support assemblies from seal face. Remove spacers from support assemblies.

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

Task 72-34-35-440-001:

1. Assemble No. 1.5 And 2 Bearing (Carbon) Seal Assembly

A. Equipment And Materials Required

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Cotter Pin	4	72-34-00	3	110
Cotter Pin	4	72-34-00	3	170

B. Procedure

See Figures 1001 and 1002.

(1) Install two short spacers over two support assemblies (short side of pin). Install four support assemblies, as noted in referenced figure, to No. 2 bearing seal face.

NOTE: If you have much wear on the flat sides of the sleeve spacers, you can install the sleeves with the wear towards the support. See Figure 1001 (Sheet 3).

(2) Install four collars and secure with four cotter pins. See 70-53, Standard Practices Manual. Invert seal face and support assemblies to collar end down.

(3) Install two long spacers over two pins already having spacers installed.

NOTE: If you have much wear on the flat sides of the sleeve spacers, you can install the sleeve spacers with the wear towards the support. See Figure 1001 (Sheet 3).

(4) Install ten springs over pins in seal face.

(5) Install seal ring in groove of No. 1.5 bearing seal face and install seal face over pins aligning pins with springs and with No. 2 bearing seal face. Be sure gap in seal ring is installed per referenced figure.

(6) Retain seal assembly against springs and install four collars and secure with four cotter pins. See 70-53, Standard Practices Manual.

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY − ASSEMBLY−01

(7) Dimensionally examine the seal assembly. Refer to the figure.

C. Postrequisites

(1) Airflow check No. 1.5 and 2 bearing (carbon) seal assembly per Testing−01 (Task 72−34−35−720−001).

1. Examine the flat sides of the sleeve spacer with a hand held stylus tool. See Figure 1002. Hold the stylus loosely at a 30 degree angle to the wear surface. Guide the stylus perpendicular to the lay of the wear. Only use the weight of the stylus, do not force the stylus with your fingers. If the stylus catches on the wear, you must install the sleeve spacer with the wear towards the support, (away from the flange).

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY - TESTING-01

Task 72-34-35-720-001:

1. Airflow Check - No. 1.5 and 2 Bearing (Carbon) Seal Assembly

   A. Prerequisites

      (1) Assemble the No. 1.5 and 2 bearing (carbon) seal assembly. Refer to Assembly-01 (Task 72-34-35-440-001).

   B. Equipment And Materials Necessary

      Special Tools:

PWA 6507	Flowmeter, Leak Test (with PWA 45411 Gage, optional to PWA 46400 Gage)
PWA 45411	Gage, Differential Pressure (with PWA 6507 Flowmeter, optional to PWA 46400 Gage)
PWA 46400	Gage, Measurement - Airflow and Differential Pressure Oil Seal Assemblies
PWA 102625	Fixture, Leak Test

   C. Procedure

      CAUTION: DURING THE FOLLOWING AIRFLOW CHECK, HANDLE THE NO. 1.5 AND 2 BEARING (CARBON) SEAL FACE ASSEMBLIES CAREFULLY. THE CARBON FACES CAN BE EASILY DAMAGED.

      (1) Prepare the 102625 Leak Test Fixture. See Figure 1301 (Sheet 1) and Figure 1301 (Sheet 2).

         (a) Attach a hoist to the lifting eye and lift the PWA 102625 Leak Test Fixture and put it on an applicable work bench. Disconnect the hoist.

         (b) Turn to loosen the lifting eye and nut assembly and remove it from the fixture.

         (c) Use the two cover handles to remove the cover from the fixture.

         (d) Remove the eight cap screws that attach the containment sleeve to the base. Remove the containment sleeve from the base.

         (e) Remove the eight cap screws and remove the top ring detail.

(f) Inspect the packings in the base of the fixture, the inner pilot ring of the cover, the top of the locating ring and the top of containment sleeve for damage.

(g) If necessary, replace the packings.

(h) If necessary, lubricate a new packing with Engine Oil P03−001.

(i) Inspect the micro finished surface of the top ring detail and the micro finished surface of the part rest detail in the base for nicks and scratches. See Figure 1301 (Sheet 1).

(j) If necessary, repair the top ring detail or the part rest detail.

(k) If not installed, install the part rest detail, micro finished surface up, in the base of the fixture and attach with the eight detail screws.

NOTE: It is permitted to use the No. 2 bearing front seal seat instead of the part rest detail.

CAUTION: HANDLE THE NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY CAREFULLY. THE CARBON FACES CAN BE EASILY DAMAGED.

(2) Install the No. 1.5 and 2 bearing (carbon) seal assembly in the fixture. See Figure 1301 (Sheet 1) and Figure 1301 (Sheet 2).

(a) Carefully install the seal assembly (No. 1.5 bearing seal face assembly down) into the base of the leak test fixture.

(b) Align the bolt holes in the No. 1.5 and 2 bearing (carbon) seal assembly flange with the eight holes in the four fixture supports. Attach with the eight detail screws.

(c) Tighten all the detail screws, hand tight.

(d) Install the top ring detail, micro finished surface down, carefully on the No. 1.5 and 2 bearing (carbon) seal assembly and attach with the eight detail screws.

NOTE: It is permitted to use the No. 1.5 bearing seal seat instead of the detail plate assembly.

(3) Install the cover of the leak test fixture.

(a) Carefully lower the containment sleeve to the base and align the attachment holes.

(b) Attach the containment sleeve to the base with the eight cap screws.

(c) Carefully lower the cover on the seal assembly and on the containment sleeve of the fixture.

CAUTION: MAKE SURE THE FOUR COVER JACK SCREWS ARE BACKED OFF SUFFICIENTLY. IF THE JACK SCREWS ARE NOT BACKED OFF, YOU CAN BEND THE COVER AND CAUSE A LEAK WHEN YOU TIGHTEN THE LIFTING EYE AND NUT ASSEMBLY.

(d) Attach the cover to the containment sleeve of the fixture with the lifting eye and nut assembly.

(4) For operators who use PWA 6507 Flowmeter and PWA 45411 Gage, connect the flowmeter and gage to the fixture:

(a) Connect the hose from the flowmeter to the fitting marked FLOW METER on the fixture cover.

(b) Attach the larger quick−disconnect fitting of the gage to the tee with the pressure relief valve marked OUTLET TO DELTA PRESSURE GAGE on the fixture cover.

(c) Attach the smaller quick−disconnect fitting of the gage on the tee fitting marked TO DELTA PRESSURE GAGE on the fixture cover

(d) Attach the air supply hose to the fitting marked INLET on the fixture cover.

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY − TESTING−01

(5) For operators who use PWA 46400 Measurement Gage, connect the gage to the fixture:

(a) Install the gage hose marked RETURN on the hose fitting to the tee fitting marked TO FLOW METER on the fixture cover.

(b) Install the gage hose marked SUPPLY on the hose fitting to the fitting marked INLET on the fixture cover.

(c) Install the gage hose marked D.P. HI. on the hose fitting to the tee with the pressure relief valve marked OUTLET TO DELTA PRESSURE GAGE on the fixture cover.

(d) Install the gage hose marked D.P. LO. on the hose fitting to the tee fitting marked DELTA PRESSURE GAGE on the fixture cover.

WARNING: DO NOT LOOSEN OR REMOVE THE LIFTING EYE AND NUT ASSEMBLY THAT ATTACHES THE COVER DURING THE AIR FLOW CHECK. THE LEAK CHECK FIXTURE IS UNDER AIR PRESSURE. IF YOU DO LOOSEN IT, THE AIR AND PARTS CAN COME OUT OF THE FIXTURE AT VERY HIGH SPEED AND CAUSE INJURY OR DEATH.

(6) Do the check for total air leakage:

(a) Supply regulated, filtered air to the fixture to 80 psi (551.6 kPa) and permit it to stabilize for five minutes.

(b) The leakage of air must not be more than 3 cu ft/min (0.08 cu m/min).

(c) If the total air leakage of the seal assembly IS in limits, remove the seal assembly from the fixture.

(d) If the total air leakage of the seal assembly IS NOT in limits, it is necessary to do a check of the leakage at the seal ring.

(7) Disconnect the PWA 6507 Flowmeter and PWA 45411 Gage from the fixture.

(a) Release the air pressure in the fixture.

NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY − TESTING−01

(b) Remove the gage hoses from the flowmeter, larger quick−disconnect fitting, smaller quick−disconnect fitting and return fitting from the fixture.

(8) Disconnect the PWA 46400 Measurement Gage from the fixture.

(a) Release the air pressure in the fixture.

(b) Remove the gage hoses marked SUPPLY, D.P. LO., D.P. HI. and RETURN from the fixture.

(9) Carefully remove the cover from the fixture.

WARNING: MAKE SURE THE AIR PRESSURE IS ZERO (0.0 PSI / 0.0 kPa) INSIDE THE LEAK TEST FIXTURE BEFORE YOU LOOSEN THE LIFTING EYE AND NUT ASSEMBLY. IF THE PRESSURE IS NOT RELEASED, THE AIR AND PARTS CAN COME OUT OF THE FIXTURE AT VERY HIGH SPEED AND CAUSE INJURY OR DEATH.

(a) Turn to loosen the lifting eye and nut assembly and remove it from the fixture.

(b) If necessary turn the four jack screws equally to loosen the cover from the fixture.

(c) Use the two cover handles to remove the cover carefully from the fixture.

(d) Remove the eight cap screws that attach the containment sleeve to the base. Carefully remove the containment sleeve from the base.

CAUTION: HANDLE THE NO. 1.5 AND 2 BEARING (CARBON) SEAL ASSEMBLY CAREFULLY. THE CARBON FACES CAN BE EASILY DAMAGED.

(10) Remove the seal assembly from the leak test fixture.

(a) Remove the eight cap screws and carefully remove the top ring detail.

(b) Remove the eight detail screws that attach the seal assembly to the four fixture supports.

(c) Carefully remove the seal assembly from the base of the fixture. Carefully put it on the workbench resting on the pins.

(11) If the seal assembly that IS IN limits, install the cover back on the fixture as follows:

(a) Install the top ring detail, micro finished surface down, carefully in the fixture and attach finger tight with the eight detail screws.

(b) Install the eight detail seal attachment screws finger tight to the four fixture supports.

(c) Carefully lower the containment sleeve to the base and align the attachment holes.

(d) Attach the containment sleeve to the base with the eight cap screws finger tight.

(e) Carefully lower the cover on the containment sleeve of the fixture.

CAUTION: MAKE SURE THE FOUR COVER JACK SCREWS ARE BACKED OFF SUFFICIENTLY. IF THE JACK SCREWS ARE NOT BACKED OFF, YOU CAN BEND THE COVER AND CAUSE A LEAK WHEN YOU TIGHTEN THE LIFTING EYE AND NUT ASSEMBLY.

(f) Attach the cover to the containment sleeve of the fixture with the lifting eye and nut assembly.

(12) If the seal assembly IS NOT inside limits, it is necessary to do a check of the leakage at the piston ring as follows:

(a) Remove the part rest detail from the base, turn it over and install it rubber ring side up in the base of the fixture. Attach with the eight detail screws.

(b) Carefully install the seal assembly (No. 1.5 seal face assembly down) to the base of the leak test fixture.

(c) Align the bolt holes in the No. 1.5 and 2 bearing (carbon) seal assembly flange with the eight holes in the four fixture supports. Attach with the eight detail screws.

(d) Tighten all the detail screws, hand tight.

(e) Install the top ring detail, rubber ring side down, carefully on the No. 1.5 and 2 bearing (carbon) seal assembly and attach with the eight detail screws.

(f) Carefully lower the containment sleeve to the base and align the attachment holes.

(g) Attach the containment sleeve to the base with the eight cap screws.

(h) Carefully lower the cover on the containment sleeve of the fixture.

CAUTION: MAKE SURE THE FOUR COVER JACK SCREWS ARE BACKED OFF SUFFICIENTLY. IF THE JACK SCREWS ARE NOT BACKED OFF, YOU CAN BEND THE COVER AND CAUSE A LEAK WHEN YOU TIGHTEN THE LIFTING EYE AND NUT ASSEMBLY.

(i) Attach the cover to the containment sleeve of the fixture with the lifting eye and nut assembly.

(j) Do another air flow check. This value is the leakage at the piston ring.

1 Subtract this value from the total leakage value. The result is the leakage at the carbon elements.

D. Postrequisites

(1) If there is leakage at the carbon elements, lap them. Refer to the PW4000 Series CIR, PN 51A357, 72-34-37, Repair-03 (Task 72-34-37-300-003) and 72-34-38, Repair-02 (Task 72-34-38-300-002).

(2) If the leakage is not within limits and not at the carbon elements, replace the piston ring. Refer to Diassembly-01 Task 72-34-35-040-001 and Assembly-01 Task 72-34-35-440-001.

72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−20 • 72−35−00−030−020: Remove The Flange J Brackets And Hardware
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−21 • 72−35−00−030−021: Remove The Flange H Brackets And Hardware
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−01 • 72−35−00−990−004: General Inspection Requirements − High Pressure Compressor (HPC)

72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−03 • 72−35−00−990−005: Visual Inspection − High Pressure Compressor (HPC)
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04 • 72−35−00−990−001: Specific Fits And Clearances • 72−35−00−990−010: Specific Fits And Clearances • 72−35−00−990−006: Specific Fits And Clearances • 72−35−00−990−011: Specific Fits And Clearances
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−05 • 72−35−00−200−005: Functional Check Inspection − Blade Tip Clearance Evaluation − High Pressure Compressor • 72−35−00−990−012: Functional Check Inspection − Blade Tip Clearance Evaluation − High Pressure Compressor (HPC)
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − REPAIR−01 • 72−35−00−300−001: Skim Cut Stages 8 Through 15 Rubstrips
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−01 • 72−35−00−400−001: Assemble High Pressure Compressor (HPC) (Pre−Ring Case Configuration) • 72−35−00−400−007: Assemble High Pressure Compressor (HPC) (Post SB PW4ENG 72−756 And SB PW4ENG 72−759)
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−02 • 72−35−00−400−002: Determine Runner Clearances • 72−35−00−400−002−A: Determine Runner Clearances (Asymetric Case Configuration)
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−03 • 72−35−00−400−003: Install And Adjust The HPC Stator Vane Lever Assembly
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−04 • 72−35−00−400−004: Install HPC External Parts • 72−35−00−400−006: Install HPC External Parts
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−05 • 72−35−00−400−005: Pre−Assemble High Pressure Compressor (HPC) Stators And Rear Cases
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−06 • 72−35−00−430−006: Assemble Stator (Vane) Segment Assemblies
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−20 • 72−35−00−430−020: Install The Flange J Brackets And Hardware

72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−21 - 72−35−00−430−021: Install The Flange H Brackets And Hardware
72−35−00	HIGH PRESSURE COMPRESSOR (HPC) − STORAGE−01 - 72−35−00−530−001: Pack High Pressure Compressor (HPC) - 72−35−00−540−001: Unpack High Pressure Compressor Group
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−01 - 72−35−01−040−001: Disassemble (Bladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−20 - 72−35−01−040−003: Disassemble (Deblade) The Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−21 - 72−35−01−040−004: Disassemble (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − INSPECTION/CHECK−00 - 72−35−01−990−001: Inspection/Check Part Number Index − Axial Compressor Rotor Assembly − Deleted
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − INSPECTION/CHECK−03 - 72−35−01−200−003: Visual Inspection − Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − REPAIR−01 - 72−35−01−300−001: Blend Installed HPC Blade Airfoils Stages 5 Through 15
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−01 - 72−35−01−440−001: Assemble (Bladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−02 - 72−35−01−440−002: Accomplish Runouts And Balance Rotor Assembly − Before Rotor Blade Tip Grinding − Axial Compressor Rotor Assembly - 72−35−01−440−005: Accomplish Runouts And Balance Rotor Assembly − Before Rotor Blade Tip Grinding − Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−03 - 72−35−01−440−003: Grind And Measure The Axial Compressor Rotor Assembly Blade Tips (Vendor Application − Informational Release)

	• 72−35−01−440−026: Grind And Measure The Axial Compressor Rotor Assembly Blade Tips (Ring Case Configuration, Post SB PW4ENG 72−756 Or Post SB PW4ENG 72−759) (Vendor Application − Informational Release)
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−04 • 72−35−01−440−004: Final Balance Axial Compressor Rotor Assembly (After The Blade Tip Grinding Operation) • 72−35−01−440−006: Final Balance Axial Compressor Rotor Assembly (After The Blade Tip Grinding Operation)
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−20 • 72−35−01−440−007: Assemble (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−21 • 72−35−01−440−008: Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−009: Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−009−A: Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Drum Rotor PN 53H973−01 Or 54H803−01 (Pre SB PW4ENG 72−565) • 72−35−01−440−009−B: Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Modified Drum Rotor PN 53H973−001 Or 54H803−001 (Post SB PW4ENG 72−565), Or PN • 72−35−01−440−009−C: Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Drum Rotor PN 56H013−01 (Post SB PW4ENG 72−565), PN 56H013−001 Or 58H236−01 (Post SB PW4ENG
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−22 • 72−35−01−440−010: Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−020: Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−020−A: Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Pre SB PW4ENG 72−565 Only) • 72−35−01−440−020−B: Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72−565 Only)
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−23 • 72−35−01−440−011: Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−021: Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly • 72−35−01−440−021−A: Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Drum Rotor PN 53H973−01, 54H803−01 (Pre SB PW4ENG 72−565), Modified Drum Rotor PN

	- 72−35−01−440−021−B: Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Drum Rotor PN 56H013−01 (Post SB PW4ENG 72−565), PN 56H013−001 Or 58H236−01 (Post SB PW4ENG
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−24 - 72−35−01−440−012: Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly - 72−35−01−440−022: Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly - 72−35−01−440−022−A: Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Pre SB PW4ENG 72−586 Only) - 72−35−01−440−022−B: Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72−586 Only)
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−25 - 72−35−01−440−013: Assemble 11Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly - 72−35−01−440−023: Assemble 11Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−26 - 72−35−01−440−014: Assemble 10Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly - 72−35−01−440−024: Assemble 10Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−27 - 72−35−01−440−015: Assemble 9Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly - 72−35−01−440−025: Assemble 9Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−28 - 72−35−01−440−016: Assemble 8Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−29 - 72−35−01−440−017: Assemble 7Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−30 - 72−35−01−440−018: Assemble 6Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly
72−35−01	AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−31 - 72−35−01−440−019: Assemble 5Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

72−35−02	VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY − DISASSEMBLY−01 • 72−35−02−040−001: Disassemble Variable Stator Vane And HPC Front Case Assembly
72−35−02	VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY − ASSEMBLY−01 • 72−35−02−440−001: Assemble Variable Stator Vane And HPC Front Case Assembly • 72−35−02−440−002: (For The Asymmetric (HPC) Case Configuration) Assemble The Variable Stator Vane And HPC Front Case Assembly
72−35−03	HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY − DISASSEMBLY−01 • 72−35−03−040−001: Disassemble HPC Stator Vane Actuator And Lever Assembly
72−35−03	HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY − ASSEMBLY−01 • 72−35−03−440−001: Assemble HPC Stator Vane Actuator And Lever Assembly
72−35−04	STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − DISASSEMBLY−01 • 72−35−04−040−001: Disassemble The HPC Outer Air Seal Set, Stages 5 Through 15
72−35−04	STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01 • 72−35−04−440−001: Assemble The HPC Outer Air Seal Set, Stages 5 Through 15
72−35−04	STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−02 • 72−35−04−440−002: Machine The Stages 5 Through 15 Outer Air Seal Set
72−35−37	STAGE 5 HPC DISK AND BLADES ASSEMBLY − DISASSEMBLY−01 • 72−35−37−040−001: Disassemble Stage 5 HPC Disk And Blades Assembly
72−35−37	STAGE 5 HPC DISK AND BLADES ASSEMBLY − ASSEMBLY−01 • 72−35−37−440−001: Assemble Stage 5 HPC Disk And Blades Assembly
72−35−37	STAGE 5 HPC DISK AND BLADES ASSEMBLY − ASSEMBLY−02 • 72−35−37−440−002: Balance Stage 5 HPC Disk And Blades Assembly
72−35−37	STAGE 5 HPC DISK AND BLADES ASSEMBLY − ASSEMBLY−03 • 72−35−37−440−003: Final Assemble Stage 5 HPC Disk And Blades Assembly
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − DISASSEMBLY−01

	- 72−35−38−040−001: Disassemble Drum Rotor And Blades (Front) Assembly
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−01 - 72−35−38−440−001: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12) - 72−35−38−440−013: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12) - 72−35−38−440−013−A: Assemble Drum Rotor And Blades (Front) Assembly (Stage 12), (Pre SB PW4ENG 72−586 Only) - 72−35−38−440−013−B: Assemble Drum Rotor And Blades (Front) Assembly (Stage 12), (Post SB PW4ENG 72−586 Only)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−02 - 72−35−38−440−002: Grind Stage 9 Through 12 HPC Blade Platforms
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−03 - 72−35−38−440−003: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11) - 72−35−38−440−017: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−04 - 72−35−38−440−004: Assemble Drum Rotor And Blades (Front) Assembly (Stage 10) - 72−35−38−440−016: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−05 - 72−35−38−440−005: Assemble Drum Rotor And Blades (Front) Assembly (Stage 9) - 72−35−38−440−015: Assemble The Drum Rotor And Blades (Front) Assembly (Stage 9)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−06 - 72−35−38−440−006: Assemble Drum Rotor And Blades (Front) Assembly (Stage 8)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−07 - 72−35−38−440−007: Assemble Drum Rotor And Blades (Front) Assembly (Stage 7)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−08 - 72−35−38−440−008: Assemble Drum Rotor And Blades Assembly (Stage 6)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−09 - 72−35−38−440−009: Assemble Drum Rotor And Blades (Front) Assembly For Balance

72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−10 • 72−35−38−440−010: Balance Drum Rotor And Blades (Front) Assembly
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−11 • 72−35−38−440−011: Post Balance Procedures − Drum Rotor And Blades (Front) Assembly
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−12 • 72−35−38−440−012: Seal Drum Rotor And Blades Assembly (Stage 6)
72−35−38	DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−13 • 72−35−38−440−014: Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front) • 72−35−38−440−014−A: Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front) (Flared Tube End Type) • 72−35−38−440−014−B: Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front) (Flared Tube Stop Type)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − DISASSEMBLY−01 • 72−35−39−040−001: Disassemble Drum Rotor And Blades (Rear) Assembly • 72−35−39−040−002−001: Disassemble The Drum Rotor And Blades (Rear) Assembly (Rear Shaft Removal Method 1) • 72−35−39−040−002−002: Disassemble Drum Rotor And Blades (Rear) Assembly (Rear Shaft Removal Method 2)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01 • 72−35−39−440−001: Install No. 3 Bearing Heat Shield • 72−35−39−440−001−A: Install No. 3 Bearing Heat Shield, Rear Shaft And Diffuser Airseal − Drum Rotor And Blades (Rear) Assembly (Pre SB PW4ENG 72−562) • 72−35−39−440−001−B: Install No. 3 Bearing Heat Shield, Rear Shaft And Diffuser Airseal − Drum Rotor And Blades (Front And Rear) Assembly (Post SB PW4ENG 72−562)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−02 • 72−35−39−440−002: Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13) • 72−35−39−440−010: Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13) • 72−35−39−440−010−A: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 13) (Drum Rotor, PN 54H803−01 Or 53H973−01, Pre SB PW4ENG 72−565 Or Modified Drum Rotor, PN 54H803−001 Or 53H973−001, Post SB PW4ENG • 72−35−39−440−010−B: Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13) (Drum Rotor, PN 56H013−01, Post SB PW4ENG 72−565 Only)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−03

	- 72−35−39−440−003: Grind Stage 13 Through 15 HPC Blade Platforms
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−04 - 72−35−39−440−004: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14) - 72−35−39−440−011: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14) - 72−35−39−440−011−A: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14), (Pre SB PW4ENG 72−565 Only) - 72−35−39−440−011−B: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14), (Post SB PW4ENG 72−565 Only)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−05 - 72−35−39−440−005: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15) - 72−35−39−440−012: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15) - 72−35−39−440−012−A: Assemble drum Rotor And Blades (Rear) Assembly (Stage 15) (Drum Rotor, PN 54H803−01 Or 53H973−01, Pre SB PW4ENG 72−565 Only) - 72−35−39−440−012−B: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15) (Modified Drum Rotor, PN 54H803−001 Or 53H973−001, Post SB PW4ENG 72−565 Only) - 72−35−39−440−012−C: Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15) (New Drum Rotor, PN 56H013−01, Post SB PW4ENG 72−565 Only)
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−06 - 72−35−39−440−006: Assemble Drum Rotor And Blades (Rear) Assembly For Balance
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY− ASSEMBLY−07 - 72−35−39−440−007: Balance Drum Rotor And Blades (Rear) Assembly
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−08 - 72−35−39−440−008: Post Balance Procedure − Drum Rotor And Blades (Rear) Assembly
72−35−39	DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−09 - 72−35−39−440−009: Assemble Drum Rotor And Blades (Rear) Assembly (Stages 13, 14 And 15) With Limited Number Of Replacement Blades Of Pre−Ground Zirconium Oxide Tips (Post SB PW4ENG 72−599)
72−35−61	STAGE 11 AND 12 COMPRESSOR STATOR SET − ASSEMBLY−01 - 72−35−61−440−001: Assemble Stages 11 And 12 Compressor Stator Set, Shroud Sets, And Springs
72−35−62	STAGE 13 AND 14 COMPRESSOR STATOR SET − ASSEMBLY−01

	- 72−35−62−440−001: Assemble Stages 13 And 14 Compressor Stator Set, Shroud Sets, And Springs

HIGH PRESSURE COMPRESSOR (HPC) − HOW TO USE

Task 72−35−00−990−003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant High Pressure Compressor (HPC) parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED − This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED − This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

HIGH PRESSURE COMPRESSOR (HPC) - HOW TO USE

HIGH PRESSURE COMPRESSOR (HPC)	72-35-00
AXIAL COMPRESSOR ROTOR ASSEMBLY	72-35-01
VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY	72-35-02
HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY	72-35-03
STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET	72-35-04
HPC FRONT HUB	72-35-05
STAGE 5 HPC DISK	72-35-06
HPC DRUM ROTOR (FRONT) DISK ASSEMBLY	72-35-07
HPC DRUM ROTOR (REAR) DISK ASSEMBLY	72-35-08
SHAFT, HPC DRIVE, TURBINE	72-35-09
DRUM ROTOR (REAR) DISK ASSEMBLY	72-35-10
STAGE 5 HPC BLADE	72-35-11
STAGE 6 HPC BLADE	72-35-12
STAGE 7 HPC BLADE	72-35-13
STAGE 8 HPC BLADE	72-35-14
STAGE 9 HPC BLADE	72-35-15
STAGE 10 HPC BLADE	72-35-16
STAGE 11 HPC BLADE	72-35-17
STAGE 12 HPC BLADE	72-35-18
STAGE 13 HPC BLADE	72-35-19
STAGE 14 HPC BLADE	72-35-20
STAGE 15 HPC BLADE	72-35-21
HPC BLADE SEALS	72-35-22
HPC BLADE OUTER AIR SEALS (8-15 STAGES)	72-35-23
STAGE 8 COMPRESSOR STATOR SEGMENT	72-35-24

HIGH PRESSURE COMPRESSOR (HPC) − HOW TO USE

STAGE 9 COMPRESSOR STATOR SEGMENT 72−35−25

STAGE 10 COMPRESSOR STATOR SEGMENT 72−35−26

STAGE 11 COMPRESSOR STATOR SEGMENT 72−35−27

STAGE 12 COMPRESSOR STATOR SEGMENT 72−35−28

STAGE 13 COMPRESSOR STATOR SEGMENT 72−35−29

STAGE 14 COMPRESSOR STATOR SEGMENT 72−35−30

HPC INLET AIRSEAL 72−35−31

(HPC) DIFFUSER AIRSEAL 72−35−32

DIFFUSER AIRSEAL DAMPER 72−35−33

COMPRESSOR TIERODS 72−35−34

COMPRESSOR TIEROD NUTS 72−35−35

NO. 3 BEARING (INNER REAR HUB) HEAT SHIELD 72−35−36

STAGE 5 HPC DISK AND BLADES ASSEMBLY 72−35−37

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY 72−35−38

DRUM ROTOR AND BLADES (REAR) ASSEMBLY 72−35−39

HPC FRONT CASE/OUTER AIRSEAL SET 72−35−40

HPC INLET SHROUD SEGMENT ASSEMBLY 72−35−41

STAGE 5 HPC SHROUD SEGMENT ASSEMBLY 72−35−42

STAGE 6 HPC SHROUD SEGMENT ASSEMBLY 72−35−43

STAGE 7 HPC SHROUD SEGMENT ASSEMBLY 72−35−44

VANE INNER TRUNNION SLEEVE BEARING AND KEY 72−35−45

VANE OUTER TRUNNION THRUST WASHER 72−35−46

HPC INLET VANE 72−35−47

HIGH PRESSURE COMPRESSOR (HPC) - HOW TO USE

STAGE 5 HPC VANE	72-35-48
STAGE 6 HPC VANE	72-35-49
STAGE 7 HPC VANE	72-35-50
HPC INLET SYNCHRONIZING RING ASSEMBLIES	72-35-51
STAGE 5 HPC SYNCHRONIZING RING ASSEMBLIES	72-35-52
STAGE 6 HPC SYNCHRONIZING RING ASSEMBLIES	72-35-53
STAGE 7 HPC SYNCHRONIZING RING ASSEMBLIES	72-35-54
HPC SYNCHRONIZING RING CLEVIS ASSEMBLIES	72-35-55
HPC SYNCHRONIZING RING PLATES	72-35-56
HPC SHROUD GUIDE ASSEMBLY HONEYCOMB AIR SEAL	72-35-57
HPC SHROUD SEGMENT ASSEMBLY	72-35-58
STAGE 8 COMPRESSOR STATOR SET	72-35-59
STAGE 9 AND 10 COMPRESSOR STATOR SET	72-35-60
STAGE 11 AND 12 COMPRESSOR STATOR SET	72-35-61
STAGE 13 AND 14 COMPRESSOR STATOR SET	72-35-62
HPC STAGE 5 SHROUD SET	72-35-63
HPC STAGE 6 AND 7 OUTER SHROUD ASSEMBLY	72-35-64
HPC SHROUD SETS (STAGE 5, 6 AND 7)	72-35-65
EXIT GUIDE VANE HEAT SHIELD	72-35-66
HPC REAR SUPPORT	72-35-67
HPC INNER REAR CASE ASSEMBLY	72-35-68
HPC (OUTER) REAR CASE ASSEMBLY	72-35-69
HPC EXIT GUIDE VANE SUPPORT	72-35-70

HIGH PRESSURE COMPRESSOR (HPC) − HOW TO USE

GEARBOX DRIVESHAFT HOUSING SUPPORT CLEVIS	72−35−71
GEARBOX DRIVESHAFT HOUSING SUPPORT LINK	72−35−72
COMPRESSOR STATOR CYLINDER SUPPORT ASSEMBLY	72−35−73
HPC LEVER SET	72−35−74
STAGE 7 HPC LEVER	72−35−75
HPC CLEVISES	72−35−76
INTERNALLY THREADED ADJUSTERS	72−35−77
ROD END BEARINGS	72−35−78
HPC LEVER SET AND ACTUATOR BEARINGS	72−35−79
HPC HEAT SHIELDS	72−35−80
HEAT SHIELD RETAINERS	72−35−81
HPC SPACER SET	72−35−82
STAGE 8 HPC CASE ASSEMBLY	72−35−83
STAGE 9 HPC CASE ASSEMBLY	72−35−84
STAGE 10 HPC CASE ASSEMBLY	72−35−85
STAGE 11 HPC CASE ASSEMBLY	72−35−86
STAGE 12 HPC CASE ASSEMBLY	72−35−87
STAGE 13 HPC CASE ASSEMBLY	72−35−88
STAGE 14 HPC CASE ASSEMBLY	72−35−89
NO. 2 BEARING FRONT SEAL SEAT	72−35−90
PLAIN ROUND NUT (NO. 2 BEARING FRONT SEAL SEAT)	72−35−91
UNASSIGNED	72−35−92
STAGE 8 AIR SEAL SUPPORT SEGMENT SET	72−35−93
GEARBOX DRIVESHAFT HOUSING SUPPORT LINK SPHERICAL BEARINGS	72−35−94

HIGH PRESSURE COMPRESSOR (HPC) − HOW TO USE

NO. 2 BEARING RETAINING NUT	72−35−95
NO. 2 BEARING NUT LOCK	72−35−96
UNASSIGNED	72−35−97 And 72−35−98
HIGH PRESSURE COMPRESSOR (HPC) MISCELLANEOUS	72−35−99

HIGH PRESSURE COMPRESSOR (HPC) − HOW TO USE

72-35-01 AXIAL COMPRESSOR ROTOR ASSEMBLY
72-35-02 VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY

HIGH PRESSURE COMPRESSOR (HPC) - DESCRIPTION AND OPERATION

Task 72-35-00-990-002:

1. High Pressure Compressor (HPC)

See Figure 1.

A. HPC General

(1) The high pressure compressor (HPC) consists of an inlet guide vane (IGV) stator assembly and an eleven stage rotor and stator assembly. The HPC is connected to the rear flange of the compressor intermediate case and to the front flange of the diffuser case. The purpose of the HPC is to further compress air delivered by the LPC and to direct this highly compressed air to the diffuser and combustor area.

(2) Customer bleed connections are provided at the 8th stage to satisfy aircraft pneumatic requirements. Twelfth stage air is delivered to a fan duct heat exchanger where the air is cooled prior to being delivered to the No. 3 bearing compartment to maintain a cool environment in that area. Twelfth stage air is also delivered to the high pressure turbine (HPT) to provide cooling for the 2nd stage turbine vanes and 2nd stage turbine blades.

(3) The HPC consists of an eleven stage (stages 5 through 15) rotor assembly, eleven stages (IGV and stages 5 through 14) of stator assemblies, the HPC cases and their externally mounted accessories. The stage 15 HPC (compressor exit) stator is addressed as part of the diffuser and combustion build group.

B. HPC Stators And Cases

(1) The stators in the HPC consists of four stages (IGV and stages 5, 6 and 7) of variable stator vanes and seven stages (stage 8 through 14) of fixed stator vanes. All HPC stator vanes are made of nickel alloy. The stage 9 stator vanes are hollow while the other HPC stator vanes are solid.

(2) The four variable vane stages are contained in the split HPC front case that is bolted together during assembly. The case is made of titanium and has a steel fire liner at stages 6 and 7. The outer trunnion of each vane is mechanically attached through the HPC front case to a synchronizing ring assembly for each stage. The four synchronizing ring assemblies are

then linked to a stator vane actuator controlled by the electronic engine control (EEC). The vanes are automatically adjusted to provide adequate stall margin for engine starting, acceleration and part power operation. Attached to the ID of the vanes are abradable rubstrips axially aligned with knife−edge seals on the drum rotor. Attached to the ID of the HPC front case are abradable rubstrips axially aligned with the stage 5, 6 and 7 blade tips.

(3) The seven fixed vane stages are mounted in the non−split titanium HPC rear case. A single stage split case stator assembly (stage 8) is bolted to a two stage split case stator assembly (stages 9 and 10). This assembly is bolted to an inner support case containing two sets of two stage stator quadrants (four 90 degree segments making up stages 11 and 12 and four 90 degree segments making up stages 13 and 14). On the ID shroud of each stator assembly are seal rings axially aligned with knife−edge seals on the drum rotor. On the OD shroud of each stator assembly are seal rings axially aligned with the rotor blade tips.

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-01

Task 72-35-00-030-001:

1. Remove HPC External Parts

A. Equipment And Materials Necessary - None

B. Procedure

Subtask 72-35-00-030-051:

(1) Remove the left and right HPC secondary-flow control valves. See Figure 501.

(a) Remove the six bolts and a bracket (Post SB PW4ENG 79-52) that attach the right valve to the HPC case. Remove the valve and discard the gasket. Remove the cap assembly (Pre SB PW4ENG 75-85), adapter, plug and gaskets from the valve. If necessary, remove the six bolts and two covers from the valve. Install protection covers.

(b) Remove the six bolts that attach the left valve to the HPC case. Remove the valve and discard the gasket. Remove the cap assembly (Pre SB PW4ENG 75-85), adapter, plug, and gaskets from the valve. Remove the six bolts, bracket (Post SB PW4ENG 72-211 only), and two covers from the valve. Install protective closures.

Subtask 72-35-00-030-052:

(2) Remove the left and right turbine vane and blade cooling air valves. See Figure 502.

(a) Remove the six bolts that attach each valve to the HPC case. Remove the valves and brackets. Discard the gaskets.

(b) Remove one adapter and one gasket from each valve.

(c) Install protective closures.

Subtask 72-35-00-030-053:

(3) Remove the left and right 9th stage start/stability (2.9) bleed valves. See Figure 503.

(a) Remove the eight bolts that attach each valve to the HPC case. Remove the valves and brackets. Discard the gaskets.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−01

(b) Remove one adapter and one gasket from each valve.

(c) If equipped remove the bolts and the cover from the boss located on the side of each bleed valve.

(d) Install protective closures.

Subtask 72−35−00−030−054:

(4) Remove the fuel/oil cooler. See Figure 504.

(a) Hold the cooler and remove the four bolts, bracket, and washers that attach the rear of the cooler to the HPC rear case bracket.

(b) For engines without the front split mount bracket (Pre SB PW4ENG 79−20), move the cooler to the rear to disengage the pin. Remove the cooler. Remove the cotter pin, nut, washer, and pin from the front of the cooler.

(c) For engines with the front split mount bracket (Post SB PW4ENG 79−20), remove the two bolts that attach the front oil cooler bracket to the HPC front case bracket. Remove the cooler. Remove the cotter pin, nut, washer, bracket retainer, and pin from the front of the cooler.

(d) Remove the two brackets, plugs, adapters, and packings from the cooler. Discard the packings.

(e) Remove the plugs, adapters, and packings from the oil cooler bypass valve. Remove the four bolts and washers that attach the bypass valve to the cooler. Remove the valve and gasket.

(f) Discard all packings and the gasket. Install protective closures.

(g) Remove the four bolts and washers that attach the main bearing strainer element housing to the top of the cooler. Remove the bracket and the housing. Discard the packing. Install the protective closures.

Subtask 72−35−00−030−055:

(5) Remove lockwire and remove four bolts securing elbow at approximately 5 o'clock location. See Figure 505. Remove elbow and gasket. Discard gasket. Remove adapter and washer.

Subtask 72−35−00−030−065:

(6) Remove bolts and nuts securing ground cable to actuator and to brackets. Remove cable and bracket.

NOTE: For engines equipped with the longer ground cable (Pre SB PW4ENG 75−31), the ground cable is attached above the support under the bolthead.

(7) For engines not equipped with nut plates riveted to support bracket (Pre SB PW4ENG 75−35), remove bolts, clamps, and nuts securing actuator and loop clamp bracket to support bracket. Remove actuator and loop clamp bracket from engine.

(8) For engines equipped with nut plates riveted to support bracket (Post SB PW4ENG 75−35), remove bolts and clamps securing actuator to support bracket. Remove actuator from engine.

Subtask 72−35−00−030−066:

(9) Remove bolts and nuts securing turbine vane and blade cooling air valve and HPC secondary flow control valve filters to Flange J brackets. Remove filters from engine. See Figure 506.

Subtask 72−35−00−030−056:

(10) Remove the Flange J hardware. Refer to 72−35−00, Disassembly−20 (Task 72−35−00−030−020).

(11) Remove bolts and brackets from front case. See Figure 507.

Subtask 72−35−00−030−067:

(12) Remove bolts, washers, and nuts securing brackets to support assembly. See Figure 508. Remove brackets and reinstall bolts to each bracket handtight.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−01

(13) Remove and discard cotter pin securing nuts to bolts on gearbox link. Loosen and remove nuts and bolts securing link. Remove link. See Figure 509.

(14) Remove bolts securing link supports to rear case. Remove supports and a bracket (Post SB PW4ENG 75−95). Remove bolts and bracket from top of rear case. Remove four bolts and fuel/oil cooler bracket.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−01

Task 72−35−00−030−005:

1. Remove HPC External Parts

A. Equipment And Materials Required − None

B. Procedure

Subtask 72−35−00−030−075:

(1) Remove the left and right HPC case covers. See Figure 501.

(a) Remove lockwire and the six bolts that attach each cover to the HPC case. On the right side of the HPC case remove the cover and bracket and on the left side of the HPC case remove the cover and bracket.

(b) Discard the gaskets and install protection covers.

Subtask 72−35−00−030−076:

(2) Remove the left and right turbine vane and blade cooling air valves. See Figure 502.

(a) Remove the six bolts that attach each valve to the HPC case. Remove the valves and brackets. Discard the gaskets.

(b) Remove one adapter and one gasket from each valve.

(c) Install protective closures.

Subtask 72−35−00−030−077:

(3) Remove the turbine vane cooling air valve from the right side of the HPC case. See Figure 503.

(a) Remove the six bolts that attach the valve to the HPC case. Remove the valve and bracket. Discard the gaskets.

(b) Remove one adapter and one gasket from the valve.

(c) Install protection covers.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−01

Subtask 72−35−00−030−078:

(4) Remove the left and right 9th stage start/stability (2.9) bleed valves. See Figure 504.

- (a) Remove the eight bolts that attach each valve to the HPC case. Remove the valves and brackets. Discard the gaskets.
- (b) Remove one adapter and one gasket from each valve.
- (c) Remove the bolts and the cover from the boss on the side of each bleed valve.
- (d) Install protective closures.

Subtask 72−35−00−030−079:

(5) Remove the fuel/oil cooler. See Figure 505.

- (a) Hold the cooler and remove the four bolts, bracket, and washers that attach the rear of the cooler to the HPC rear case bracket.
- (b) Remove the two bolts that attach the front oil cooler bracket to the HPC front case bracket. Remove the cooler.
- (c) Remove the bracket from the pin. Remove the cotter pin, nut, washer, bracket retainer, and pin from the front of the cooler.
- (d) Remove the two brackets, plugs, adapters, and packings from the cooler. Discard the packings.
- (e) Remove the plugs, adapters, and packings from the oil cooler bypass valve. Remove the four bolts and washers that attach the bypass valve to the cooler. Remove the valve and gasket.
- (f) Discard all packings and the gasket. Install protective closures.
- (g) Remove the four bolts and washers that attach the main bearing strainer element housing to the top of the cooler. Remove the bracket and the housing. Discard the packing. Install the protective closures.

Subtask 72-35-00-030-080:

(6) Remove the lockwire and four bolts that attach the elbow at approximately the 5 o'clock position. See Figure 506. Remove the elbow and gasket. Discard the gasket. Remove the adapter and washer.

Subtask 72-35-00-030-081:

(7) Remove the bolts and nuts that attach the ground cable to the actuator and to brackets. Remove the cable and bracket.

(8) Remove the bolts and clamps that attach the actuator to the support bracket. Remove the actuator from the engine.

Subtask 72-35-00-030-082:

(9) Remove the bolts and nuts that attach the turbine vane and blade cooling air valve filters to the brackets on Flange J. Remove the filters from the engine. See Figure 507.

Subtask 72-35-00-030-083:

(10) Remove the Flange J hardware. Refer to 72-35-00, Disassembly-20 (Task 72-35-00-030-020).

(11) Remove the bolts and brackets from the HPC front case. See Figure 508.

Subtask 72-35-00-030-084:

(12) Remove the bolts, washers, and nuts that attach the brackets to the support assembly. See Figure 509 . Remove the brackets and install the bolts to each bracket handtight.

(13) Remove and discard the cotter pin that attach the nuts to the bolts on the gearbox link. Loosen and remove the nuts and bolts that attach the link. Remove the link. See Figure 510.

(14) Remove the bolts that attach the link supports to the rear case. Remove the supports and a bracket. Remove the bolts and bracket from the top of the rear case. Remove the four bolts and the fuel/oil cooler bracket.

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-02

Task 72-35-00-030-002:

1. Remove HPC Stator Vane Actuator And Lever Assembly

A. Equipment And Materials Required - None

B. Procedure

Subtask 72-35-00-030-057:

(1) (Pre SB PW4ENG 72-534) Remove wire and remove two cotter pins from each of the two upper support studs of the support assembly. Discard cotter pins. Remove nuts from each stud. Remove studs.

(2) (Post SB PW4ENG 72-534) Remove two cotter pins from each of the two upper support expandable studs (called studs) of the support assembly. Discard cotter pins. Remove nuts and washers from each end of the studs. Remove studs.

NOTE: (Post SB PW4ENG 72-534) Removal of the stud from the front attachment lug may require that the 5th stage unison ring be rotated to allow the stud to be removed through the hole in the clevis.

(3) Remove cotter pin from bolt and nut attaching brace to support assembly. Discard cotter pin. Remove nut and bolt.

(4) (Pre SB PW4ENG 72-506) Remove cotter pins securing nuts and bolts to each of the four links and synchronizing rings. Discard cotter pins. Remove nuts, washers (on stages where applicable) and bolts from rings.

(5) (Post SB PW4ENG 72-506) Remove cotter pins securing nut and bolts to each of the four links and synchronizing rings. Discard cotter pins. Remove nuts and bolts from rings.

(6) Remove cotter pins from bolts securing bottom of support to front case. Discard cotter pins. Remove nuts and bolts.

(7) Remove vane actuator and lever assembly and place on bench. Install protective closures to openings.

Subtask 72-35-00-030-058:

(8) Remove four bolts securing bracket to HPC front case at approximately 3 o'clock location. Remove bracket.

(9) Remove cotter pins securing bolts retaining brace to HPC front case at approximately 4 o'clock location. Remove nuts and bolts. Remove brace from front case.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−03

Task 72−35−00−030−003:

1. Disassemble High Pressure Compressor (HPC)

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (4 Necessary)
PWA 80515	Stand
PWA 85086	Lift Arm
PWA 85108	Stand, Support (Optional to PWA 85580 and PWA 87022)
PWA 85124	Adapter, Lift
PWA 85159	Protector, Thread (Optional Tools)
PWA 85160	Protector, Thread (Optional Tools)
PWA 85294	Adapter, Support
PWA 85528	Adapter, Handling
PWA 85529	Nut, Retaining
PWA 85530	Wrench, Torque
PWA 85531	Adapter, Torque
PWA 85532	Bracket, Lift
PWA 85537	Fixture, Handling (For Compressors With A Symmetric Case)
PWA 85580	Stand, Support (Optional to PWA 85108 and PWA 87022)
PWA 85593	Adapter, Ring
PWA 85743	Puller, Jackscrew
PWA 85744	Puller, Knocker
PWA 86098	Pusher, Mechanical (3 Necessary, Optional to PWA 86588)
PWA 86220	Puller, Jackscrew
PWA 86536	Adapter, Torque
PWA 86588	Puller, Mechanical (Optional to PWA 102033)
PWA 87022	Stand, Support
PWA 88560	Fixture, Handling (For Compressors With An Asymmetric Case)
PWA 88643	Sling, Lifting (Optional to PWA 88673 and PWA 102286)
PWA 88673	Sling, Lifting (Optional to PWA 88643 and PWA 102286)
PWA 88700	Adapter, Lift
PWA 102033	Puller, Mechanical
PWA 102286	Adapter, Lift (Optional to PWA 88673 and PWA 88643)

B. Procedure

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-03

Subtask 72-35-00-030-059:

(1) Remove borescope plugs from locations at 5, 8, 8:30 and 9:30 o'clock on HPC rear case. Discard key washers.

(2) Remove bolts securing cover to HPC rear case at approximately 2:30 o'clock position. Remove cover and discard gasket. See Figure 501.

Subtask 72-35-00-030-060:

(3) Attach PWA 85528 Adapter to HPC front hub. Secure with PWA 85529 Nut, using PWA 85530 Wrench and PWA 85531 Adapter. Torque nut to 300 lb-in. (33.895 N.m). Attach PWA 85537 Fixture (for compressors with the symmetric case), or the PWA 88560 Fixture (for compressors with the asymmetric case) and adapter to the HPC front case.

(4) Install hoist and PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to fixture on front end of HPC. Raise HPC from stand and install second hoist and PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to fixture on rear case. Trunnion HPC to front end down on PWA 87022 Support Stand (Optional PWA 85580 Support Stand or PWA 85108 Support Stand). Remove bottom hoist, sling and adapters from fixture.

(5) Remove attaching hardware from rear fixture on rear case and hub. Using hoist and sling attached, remove rear fixture from HPC.

Subtask 72-35-00-030-061:

(6) Remove the Flange H hardware as follows. Refer to 72-35-00, Disassembly-21 (Task 72-35-00-030-021).

(7) Remove nuts, bolts, and washers securing runner assemblies. Remove runners and shims from flange.

(8) Remove 62 bolts securing HPC exit guide vane support to HPC inner rear case assembly.

NOTE: Some HPC compressors will not have HPC exit guide vane support and heat shield.

(9) Install PWA 85744 Puller over rim of support and secure with hand knob. Use sliding action to remove support. Remove puller. Remove heat shield.

(10) (Pre SB PW4ENG 72-602) Install PWA 86220 Puller or PWA 85743 Puller and locate it around HPC rear hub. Rest puller on case and rotate puller to allow jaws to slip under HPC rear support pull tabs. Apply equal turns to jackscrews to remove support. Remove puller.

NOTE: PWA 86220 Puller is used with supports having eight pull tabs (Post SB PW4ENG 72-298). Alternatively, if PWA 85743 Puller is to be used with supports having three pull tabs (Pre SB PW4ENG 72-298), use mallet and nylon drift to facilitate removal.

(11) (Post SB PW4ENG 72-602) Install PWA 101002 Puller or PWA 102301 Puller onto the HPC rear support.

NOTE: PWA 101002 Puller or PWA 102301 Puller is used with supports having a continuous full ring lip for puller clamp engagement (Post SB PW4ENG 72-602).

(a) Install PWA 101002 Puller onto the HPC rear support. Engage the four detail clamps under the full ring puller lip of the rear support. Tighten the 12 detail flange nuts to lock the clamps in position under the puller lip. After the clamps are positioned under the puller lip, continue to tighten the 12 flange nuts one at a time about one half turn until the rear support is removed from the HPC rear case. Remove the puller.

(b) Install PWA 102301 Puller onto the HPC rear support. Pull the four detail clamps under the puller lip of the rear support. Tighten the 12 detail cap screws to lock the clamps and rocker plates in position against the puller lip. After the clamps are correctly positioned under the puller lip, tighten the 12 flange nuts one at a time about one half turn until the rear support is disassembled from the rear case. Remove the puller.

(12) Remove 64 bolts from inside rear case which secures rear case and inner case to 9th and 10th stator set.

(13) Remove the 16 bolts that attach the eight thrust pins or thrust pin covers to the HPC inner rear case. Turn the rear case as necessary to remove the bolts.

(14) Remove the two bolts and nuts that attach the identification plate to the bracket on the HPC rear case Flange J.

(15) Remove borescope plugs from Stages 9, 10, 13 and 14 stators. Rotate rear case to remove plug over bleed port.

(16) Use a hoist and install either the PWA 88643 Sling or the PWA 88673 Sling or the PWA 102286 Lift Adapter to the HPC rear case. Raise the HPC rear case from the HPC. Put the case on the storage rack and remove the hoist and either the sling or the lift adapter from the case.

(17) Remove two gaskets from stage 9 stator and place on storage rack.

Subtask 72−35−00−030−062:

(18) Remove HPC inner rear case from stators, using PWA 102033 Puller, Mechanical. When case does not bind during removal, PWA 86098 Pullers can be used as optional tools for removing case, as follows:

(a) Secure three PWA 86098 Pushers equally spaced around rear flange of inner rear case with five cap screws.

(b) Install pusher with groove fitting into stepped groove in stator assembly.

(c) Turn single cap screw alternately between the three pushers to remove inner case.

(19) Remove Stages 13 and 14 with seals from HPC.

(20) Remove Stages 11 and 12 with seals from HPC.

(21) Remove 40 bolts securing Stage 9 and 10 to Stage 8. Remove 10 bolts and nuts securing Stages 9 and 10 set together. If applicable, remove featherseals and remove Stages 9 and 10.

(22) Remove 8 bolts and nuts securing Stage 8 set together. If applicable, remove featherseals and remove Stage 8 when front cases are removed.

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-03

Subtask 72-35-00-030-063:

(23) Remove 12 bolts securing three clevis assemblies to rings at 3 o'clock location. Remove clevis assemblies. Remove 12 bolts securing three plates to rings at 9 o'clock location. Remove plates. Discard all key washers.

CAUTION: (POST SB PW4ENG 72-485) THE 5TH THROUGH 7TH STAGE OUTER SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED AND MACHINED AS A MATCHED SET. THESE PARTS MUST BE KEPT TOGETHER AS A SET.

(24) Use PWA 86536 Adapter and remove the 22 nuts and bolts that attach the case halves together. Remove the hardware that attaches the front case to the adapter. Turn the 8th stage stator to align the splits. Use a hoist and two PWA 85532 Brackets installed at the fourth, fifth and sixth holes from the stator split line and remove one of the two case halves with the half stator. Do this procedure again for the remaining case half and half stator. Remove the stator halves from the case halves. Remove the two locks from the case halves.

Subtask 72-35-00-030-064:

(25) Use a hoist and install PWA 85593 Ring Adapter to the PWA 87022 Support Stand (Optional PWA 85580 Stand or PWA 85108 Stand). Use a hoist and install the PWA 80515 Support Stand onto the PWA 85593 Adapter and PWA 87022 Support Stand (Optional PWA 85580 Support Stand or PWA 85108 Stand) and attach in position.

(26) FOR THESE MODELS: 4152, 4156A, 4158
Install PWA 85124 Adapter to threads on rear shaft. Attach PWA 85086 Arm to installed adapter. Attach hoist to arm and raise rotor assembly from build stand.

(27) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
(Pre SB PW4ENG 72-562) Install the PWA 85124 Adapter to the threads on the rear shaft. Attach the PWA 85086 Arm to the installed adapter. Attach the hoist to the arm and raise the rotor assembly from the build stand.

(28) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Post SB PW4ENG 72−562) Install the PWA 88700 Adapter to the threads on the rear shaft. Attach the PWA 85086 Arm to the installed adapter. Attach the hoist to the arm and raise the rotor assembly from the build stand.

(29) Install PWA 88643 Sling or PWA 88673 Sling to the adapter on front hub. Attach hoist to sling and trunnion rotor assembly to rear end down. Remove hoist, arm and adapter from rear shaft.

(30) Lower assembly down into PWA 80515 Stand with PWA 85294 Adapter. Remove nut, adapter and fixture from front hub. Install PWA 85160 Thread Protector on front hub and PWA 85159 Thread Protector on rear shaft.

NOTE: PWA 85159 Thread Protector and PWA 85160 Thread Protector are optional and some other type of thread protection can be used.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−03

PW V

Cover − HPC Rear Case
Figure 501
(Task 72−35−00−030−003)

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-03

Task 72-35-00-030-006:

1. Disassemble The High Pressure Compressor (HPC) (Ring Case Configuration)

A. Prerequisites

(1) Remove The HPC External Parts. Refer to 72-35-00, Disassembly-01 (Task 72-35-00-030-001) or (Task 72-35-00-030-005) as applicable.

(2) Remove The Flange J Brackets And Hardware. Refer to 72-35-00, Disassembly-20 (Task 72-35-00-030-020).

B. Equipment And Materials Necessary

Standard Tools:

Optional, Wrench (Extended Socket) Part No. QCL 5/16-2D-3/16 Used With Optional Cleco Air Gun	Brimatco Corporation P.O. Box 88 1486 Highland Ave. Cheshire, CT 06410 USA
Optional Cleco Air Gun (Nutrunner) PN 44RNAL-2-H-3, or PN 44RNAL-2RA8 Or Equivalent	Local Distributor Or, Cooper Tools Sales and Service P.O. Box 1410 Lexington, SC 29071-1410 USA
Optional, Flexible Extension Part No. GSYMU101 Or Equivalent	Snap-On Technologies Inc. P.O. Box 1430 Kenosha, WI 53141-1430 USA

NOTE: The optional Brimatco wrench (extended socket) PN QCL 5/16-2D-3/16 can be use with the Cleco Air Gun to help remove the flange nuts on the 8th through 14th stage compressor cases.

Special Tools:

	PWA 76154	Adapter (2 Necessary)
	PWA 80515	Stand, Support
	PWA 85086	Arm, Lift
	PWA 85108	Stand, Support (Optional To PWA 85580 And PWA 87022)
	PWA 85124	Adapter, Lift
	PWA 85159	Protector, Thread (Optional Tools)
	PWA 85160	Protector, Thread (Optional Tools)
	PWA 85294	Adapter, Support
	PWA 85528	Adapter, Handling
	PWA 85529	Nut, Retaining
	PWA 85530	Wrench, Torque
	PWA 85531	Adapter, Torque
	PWA 85532	Bracket, Lift
	PWA 85537	Fixture, Handling
	PWA 85580	Stand, Support
	PWA 85593	Ring, Adapter
R R	PWA 86536	Adapter, Torque (HPC Front Case Split Flange Nuts) (Optional to PWA 107300)
	PWA 87022	Stand, Support
	PWA 88643	Sling, Lifting (Optional To PWA 88673)
	PWA 88673	Sling, (2 Necessary)
	PWA 88700	Adapter, Lift (Post SB PW4ENG 72-562)
	PWA 100383	Adapter, Torque (14th Stage Case At Borescope Location)
	PWA 102260	Adapter, Torque
	PWA 105504	Adapter, Lift (HPC Rear Case)
	PWA 105562	Puller, Jackscrew (15th Stage Air Seal)
	PWA 105588	Puller, Jackscrew (8th Stage Case) (3 Necessary)
	PWA 107299	Adapter, Breakaway (HPC Case Flange Nuts)
R R	PWA 107300	Adapter, Breakaway (HPC Front Case Split Flange Nuts) (Optional to PWA 86536)

C. Procedure

NOTE: The HPC outer airseal set (Stages 5 through 15) (called seal set) consists of the HPC front case set, 5th through 7th stage HPC shroud sets, 8th through 15th stage compressor air seal assemblies, 8th through 14th stage compressor case assemblies, HPC rear support, classified spacer, and the HPC rear case. The matched set detail parts are identified by the Letter M followed by the last five digits of the HPC rear case serial number. These parts should be identified and kept together as a set.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−03

Subtask 72−35−00−030−085:

(1) Remove borescope plugs from locations at 5, 8, 8:30 and 9:30 o'clock on HPC rear case. Discard the key washers. See Figure 501.

(2) Remove bolts from the HPC rear case at approximately 2:30 o'clock position. See Figure 502.

Subtask 72−35−00−030−087:

(3) Trunnion the HPC to the front end down position.

- (a) Attach the PWA 85528 Adapter to HPC front hub.
- (b) Use the PWA 85530 Wrench and PWA 85531 Adapter to attach the PWA 85528 Adapter with the PWA 85529 Nut.
- (c) Torque the Nut to 300 lb−in. (33.895 N.m).
- (d) Attach the PWA 85537 Fixture and Adapter and HPC front case.
- (e) Install a hoist and the PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to the Fixture on front end of the HPC.
- (f) Raise HPC from stand and install second hoist and PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to the Fixture on the HPC rear case.
- (g) Trunnion the HPC to the front end down on PWA 87022 Support Stand (Optional PWA 85580 Support Stand or PWA 85108 Support Stand).
- (h) Remove bottom hoist, Sling and Adapters from the Fixture.
- (i) Remove the attaching hardware from rear Fixture on the HPC rear case and hub.
- (j) Using the hoist and Sling attached, remove the rear Fixture from the HPC.

Subtask 72−35−00−030−088:

(4) Remove four bolts and key washers from each of the synchronizing ring clevis assemblies installed at the 3 o'clock locations on the HPC front case. Remove the four clevis assemblies and discard the key washers.

NOTE: Be careful when you remove the bolts. Loosen the bolts in small equal amounts to prevent damage to the nutplates.

(5) Remove four bolts and key washers from the synchronizing ring plates installed at the 9 o'clock locations on the HPC front case. Remove the four plates and discard the key washers.

NOTE: Be careful when you remove the bolts. Loosen the bolts in small equal amounts to prevent damage to the nutplates.

Subtask 72−35−00−030−089:

(6) Remove the 15th stage compressor heat shields. See Figure 503.

(a) Remove the bolts (503/3), bushings (503/4), and spacer plates (503/5) and covers (503/6) that attach the heat shields to the HPC rear support.

NOTE: You can use the PWA 107299 Adapter or the PWA 102260 Torque Adapter with a 3/8 inch drive to loosen the case flange nuts in the steps that follow.

(b) Remove the 15th stage compressor heat shield upper (503/2) and lower (503/1) from the HPC rear support.

(7) Remove the HPC rear support. See Figure 504.

(a) Remove the bolts (504/6) and washers (504/7) that attach the HPC rear support (504/5) to the HPC rear case.

(b) Remove the bolts (504/1) and washers (504/2), nuts (504/2) and washers (504/4) that attach the HPC rear support (504/5) to the 15th stage air seal.

(c) Install 12 (.250-28) jackscrews in the threaded holes in the inner flange of the rear support.

(d) Evenly tighten the jackscrews to loosen the HPC rear support (504/5).

(e) Remove the HPC rear support from the case assembly.

(f) Remove the jackscrews.

(g) Remove the HPC spacers (504/8) from the HPC rear case.

(h) The HPC rear support and the HPC rear case is matched set. Use a suitable tag, or use an approved marker to make marks on the support to indicate that these parts must be kept together as a matched set.

Subtask 72-35-00-030-090:

(8) Remove the Flange H hardware. Refer to 72-35-00, Disassembly-21 (Task 72-35-00-030-021).

(9) Remove the 7th stage runners and shims.

(10) Remove the HPC rear case (505/1). See Figure 505.

(a) Attach the PWA 105504 Adapter to the HPC rear case.

1 Attach a hoist to the lift hole in the Adapter.

2 Use the hoist to lift the Adapter and put it over the HPC module.

3 Align the boltholes in the Adapter with the boltholes in the case.

NOTE: The Adapter has a scribed line on the OD of the outer ring. Align this line with the offset hole in the rear flange of the HPC rear case.

4 Install the Adapter to the rear case with eight detail screw assemblies and four nut plates.

(b) Remove the bolts, washers, brackets, and nuts that attach the HPC rear case (505/1) to the rear flange of the HPC front case.

(c) Install .250-28 jackscrews in the threaded holes in the front flange of the HPC rear case.

(d) Evenly tighten the jackscrews to remove the HPC rear case.

(e) Remove the jackscrews.

(f) Use the hoist to remove the rear case from the HPC module. Put the case on a pallet.

(g) Remove the screw assemblies and nut plates that attach the Adapter to the case.

(h) Remove the Adapter from the case.

(i) The HPC rear case and the HPC rear support is a matched set. Use a suitable tag, or use an approved marker to make marks on the case to indicate that these parts must be kept together as matched set.

(11) Remove the seals from the case assemblies. See Figure 506.

(a) Remove the seal (506/1) from the vertical (seal holder) groove in the front flange of the 12th stage case.

(b) Remove the seal ring seal (506/2) from the (seal holder) groove in the 12th stage case.

(c) Remove the seal ring (spring) (506/3) from the (seal holder) groove in the 12th stage case.

(d) Remove the gasket (506/4) from the upper groove in the 9th stage case. Discard the gasket.

Subtask 72-35-00-030-091:

(12) Remove the 9th stage compressor heat shields. See Figure 507 (Sheets 1 and 2).

(a) Remove the nuts (507/3), bushings (507/4), spacers (507/5), spacers (507/7), covers (507/6), bushing (507/8) and bolts (507/9), that attach the 9th stage compressor upper and lower heat shields (507/10) to the 8th and 9th stage case flanges. See Figure 507 (Sheet 2).

(b) Rotate and remove the left and right outer rear heat shields (507/1).

(c) Rotate and remove the upper and lower inner heat shield (507/2) from the groove in the forward flange of the 9th stage case.

(13) Remove the 11th stage compressor heat shield. See Figure 508.

(a) Remove the 24 bolts (508/3) that attach the heat shield retainers (508/4), (508/5), and 10th stage compressor heat shields (508/2) to the rear flange of the 9th stage compressor case.

(b) Lower the heat shield to remove it from the groove between the 11th and 12th stage case flanges.

(c) Expand and remove the heat shield (508/1) from the cases.

(14) Remove the 12th stage compressor rear heat shields. See Figure 509.

(a) Remove the bolts (509/1), bushings (509/2), spacers (509/3), and nuts (509/6) that attach the 12th stage compressor rear heat shields (509/8) to the front flange of the 12th stage case.

(b) Rotate and remove the left and right outer rear heat shields (509/4) and (509/8).

(c) Rotate and remove the upper and lower inner rear heat shields (509/5) and (509/7).

(15) Remove the 15th stage compressor air seal (510/1) with the PWA 105562 Puller. See Figure 510 (Sheet 1).

(a) Turn the 12 detail hex head screws to flush or below the detail ring segments.

(b) Loosen the four detail hand knobs.

(c) Remove the four detail pins.

(d) Expand the ring segments and install the four detail pins in the hole locations marked "A".

(e) Align the hole to the right of the TDC mark on the Puller with the bolt at the 12 o'clock on the air seal (510/1).

(f) Align the remaining bolts from the 15th stage air seal with the remaining holes in the detail segments. Make sure the 12 detail hex head screws are aligned with the 12 through holes in the air seal and install the Puller to the air seal (510/1).

(g) Remove the four detail pins.

(h) Contract the ring segments to engage the air seal puller groove, until four detail pins can be installed in the hole location marked "B".

(i) Tighten the four detail hand knobs.

(j) Turn the 12 detail hex head screws evenly in small increments until the air seal (510/1) is removed from the 14th stage compressor case.

(k) Remove the Puller.

(l) Remove the air seal (510/1).

(16) Remove the 13th and 14th stage compressor heat shield and retainers. See Figure 510 (Sheet 2).

(a) Remove the 13th and 14th stage compressor heat shield (510/1) from the 13th stage heat shield retainers.

(b) Remove the 24 bolts (510/5) that attach the 13th stage compressor heat shield retainers (510/2) and (510/4), and the 13th stage compressor heat shields (510/3) to the 12th stage compressor case.

Subtask 72−35−00−030−092:

(17) Remove the 14th stage compressor case assembly.

(a) Remove the bolts and nuts that attach the 14th stage case and air seal to the 13th stage case. If necessary, use the PWA 100383 Torque Adapter to remove the nuts at the borescope location.

(b) Install 12 (.250−28) jackscrews in the threaded holes in the front flange of the 14th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and case.

(18) Carefully remove the 14th stage vane stator segments.

(19) Remove the 14th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 13th stage case.

(b) Evenly tighten the jackscrews to loosen the 14th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−093:

(20) Remove the 13th stage compressor case assembly.

(a) Remove the bolts and nuts that attach the 13th stage case and air seal to the 12th stage case.

(b) Install 12 (.250−28) jackscrews in the threaded holes in the front (lower) flange of the 13th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and case.

(21) Carefully remove the 13th stage vane stator segments.

(22) Remove the 13th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 12th stage case.

(b) Evenly tighten the jackscrews to loosen the 13th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−094:

(23) Remove the 12th stage compressor case assembly.

(a) Remove the nuts and bolts that attach the 12th stage case and air seal to the 11th stage case.

(b) Install 12 (.250−28) jackscrews in the threaded holes in the front (lower) flange of the 12th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and case.

(24) Carefully remove the 12th stage vane stator segments.

(25) Remove the 12th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 11th stage case.

(b) Evenly tighten the jackscrews to loosen the 12th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−095:

(26) Remove the 11th stage compressor case assembly.

(a) Use the PWA 102260 Torque Adapter with a 3/8 inch drive to loosen and remove the nuts that attach the 11th stage case and air seal to the 10th stage case. Remove the bolts.

(b) Remove the washers from the dowel bolts.

(c) Install 12 (.250−28) jackscrews in the threaded holes in the front flange of the 11th stage case.

(d) Evenly tighten the jackscrews to loosen the case.

(e) Remove the case and jackscrews.

(27) Carefully remove the 11th stage vane stator segments.

(28) Remove the 11th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 10th stage case.

(b) Evenly tighten the jackscrews to loosen the 11th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−096:

(29) Remove the 10th stage compressor case assembly.

(a) Remove the bolts and nuts that attach the 10th stage case and air seal to the 9th stage compressor case.

(b) Install 12 (.250−28) jackscrews in the threaded holes in the front (lower) flange of the 10th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and case.

(30) Carefully remove the 10th stage vane stator segments.

(31) Remove the 10th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 9th stage case.

(b) Evenly tighten the jackscrews to loosen the 10th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−097:

(32) Remove the 9th stage compressor case assembly.

(a) Remove the bolts and nuts that attach the 9th stage case and air seal to the 8th stage case.

(b) Install 12 (.250−28) jackscrews in the threaded holes in the front (lower) flange of the 9th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and case.

(33) Carefully remove the 9th stage vane stator segments.

(34) Remove the 9th stage compressor air seal.

(a) Install 12 (.250−28) jackscrews in the threaded holes in the rear (upper) flange of the 8th stage case.

(b) Evenly tighten the jackscrews to loosen the 9th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−00−030−098:

(35) Remove the 8th stage compressor case assembly.

(a) For the symmetric case configuration, remove the nuts (511/1) and washers (511/2) that attach the 8th stage case (511/3) to the 8th stage compressor air seal. See Figure 511 (Sheet 1).

NOTE: You can use a flexible extension (such as a Snap−On GSYMU101) to remove the nuts (511/1).

(b) For the asymmetric case configuration, remove the bolts (511/2) and washers (511/3) that attach the 8th stage case (511/1) to the 8th stage compressor air seal. See Figure 511 (Sheet 2).

(c) Turn the PWA 105588 Puller threaded driver detail counterclockwise to collapse the Puller assembly.

(d) Put three Pullers approximately equally spaced between the 8th stage case flanges.

(e) Put the detail pin in the through hole in the front (lower) flange of the case (511/3) so it contacts the 8th stage compressor air seal.

(f) Turn the driver clockwise until the housing assembly contacts the rear flange of the case.

(g) Use a standard wrench to turn the detail driver of the three Pullers approximately one turn each, one at a time, to remove the case (511/3). Remove and reposition the three pullers to another three equally spaced locations as necessary to remove the case (511/3).

(h) Remove the Pullers.

(i) Remove the case (511/3).

(36) Carefully remove the 8th stage vane stator segments.

(37) Remove the 8th stage compressor air seal (512/1). See Figure 512.

(38) For the symmetric case configuration, remove the air seal support segment set from the 8th stage compressor air seal. See Figure 513.

(a) Remove the eight screws (513/2) that attach the support segments to the air seal (513/1).

(b) Remove the four support segments (513/4) and eight spacers (513/3) from the air seal.

Subtask 72-35-00-030-099:

(39) Remove the HPC front case and vane assembly segments from the Support Fixture. See Figure 514.

R (a) Use the PWA 86536 and/or PWA 107300 Adapters to
R remove the 22 nuts (506/1) and bolts (506/2) that attach the HPC front case set upper and lower segments.

(b) Remove the detail nuts and bolts that attach front (lower) flange of the HPC front case segments to the Support Fixture.

(c) Install the PWA 85532 Lifting Brackets to the upper HPC front case segment.

(d) Attach a hoist and suitable sling to the Brackets and carefully remove the case and vane assembly from the rotor assembly.

(e) Repeat the above steps to remove the lower HPC front case segment.

(40) If necessary, remove the locks and the 5th stage shroud set segments.

Subtask 72−35−00−030−100:

(41) Use a hoist and install the PWA 85593 Ring Adapter to the PWA 87022 Support Stand (Optional PWA 85580 Stand or PWA 85108 Stand). Use a hoist and install the PWA 80515 Support Stand onto the PWA 85593 Adapter and PWA 87022 Support Stand (Optional PWA 85580 Stand or PWA 85108 Stand) and attach in position.

(42) Install the PWA 85124 Adapter to the threads on the rear shaft. Attach PWA 85086 Arm to the installed Adapter. Attach a hoist to the Arm and raise the rotor assembly from the Build Stand.

(43) (Pre SB PW4ENG 72−562) Install the PWA 85124 Adapter to the threads on the rear shaft. Attach the PWA 85086 Arm to the installed Adapter. Attach the hoist to the Arm and raise the rotor assembly from the Build Stand.

(44) (Post SB PW4ENG 72−562) Install the PWA 88700 Adapter to the threads on the rear shaft. Attach the PWA 85086 Arm to the installed Adapter. Attach the hoist to the Arm and raise the rotor assembly from the Build Stand.

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-03

(45) Install PWA 88643 or PWA 88673 Sling to the Adapter on front hub. Attach hoist to sling and trunnion rotor assembly to rear end down. Remove hoist, Arm and Adapter from rear shaft.

(46) Lower the assembly down into the PWA 80515 Stand with the PWA 85294 Adapter. Remove the Nut, Adapter and Fixture from the front hub. Install the PWA 85160 Thread Protector on the front hub and the PWA 85159 Thread Protector on the rear shaft.

NOTE: The PWA 85159 Thread Protectors and PWA 85160 Thread Protector are optional and some other type of thread protection can be used.

D. Postrequisites

(1) Disassemble The Variable Stator Vane And HPC Front Case Assembly. Refer to 72-35-02, Disassembly-01 (Task 72-35-02-040-001).

(2) Disassemble (Deblade) The Axial Compressor Rotor Assembly. Refer to 72-35-01, Disassembly-20 (Task 72-35-01-040-003).

(3) Disassemble (Debladed) The Axial Compressor Rotor Assembly. Refer to 72-35-01, Disassembly-21 (Task 72-35-01-040-004).

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-04

Task 72-35-00-030-004:

1. (Pre Ring Case Configuration) Disassemble Stator And Rear Case Pre-Assembly - High Pressure Compressor (HPC)

A. Equipment And Materials Required

Special Tools:

PWA 85537	Fixture, Handling
PWA 85743	Fixture, Handling (3 Necessary, Optional to PWA 86220) (Pre SB PW4ENG 72-602)
PWA 86098	Pusher, Mechanical
PWA 86220	Puller, Jackscrew (Pre SB PW4ENG 72-602)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 101002	Puller, Jackscrew (Post SB PW4ENG 72-602) (Optional to PWA 102301)
PWA 101980	Bracket, Lift (2 Necessary)
PWA 102033	Puller, Mechanical
PWA 102301	Puller, Jackscrew (Post SB PW4ENG 72-602) (Optional to PWA 101002)

B. Procedure

Subtask 72-35-00-030-068:

(1) Using the PWA 85537 or PWA 88560 Handling Fixture as applicable, lower the stator case assembly (front end down) onto rotary table. Remove attaching hardware from rear fixture on rear case and remove rear fixture from HPC.

Subtask 72-35-00-030-069:

(2) Loosen 62 bolts that secure rear support to the rear (outer) case. See Figure 501.

(3) (Pre SB PW4ENG 72-602) Install PWA 86220 Puller or PWA 85743 Puller on rear case and rotate puller to allow jaws to slip under HPC rear support pull tabs. Apply equal turns to jackscrews to remove support. Remove puller.

NOTE: PWA 86220 Puller is used with supports having eight pull tabs (Post SB PW4ENG 72-298). Alternatively, if PWA 85743 Puller is to be used with supports having three pull tabs (Pre SB PW4ENG 72-298), use mallet and nylon drift to facilitate removal.

(4) (Post SB PW4ENG 72−602) Install PWA 101002 Puller or PWA 102301 Puller onto the HPC rear support.

NOTE: PWA 101002 Puller or PWA 102301 Puller is used with supports having a continuous full ring lip for puller clamp engagement (Post SB PW4ENG 72−602).

(a) Install PWA 101002 Puller onto the HPC rear support. Engage the four detail clamps under the full ring puller lip of the rear support. Tighten the 12 detail flange nuts to lock the clamps in position under the puller lip. After the clamps are positioned under the puller lip, continue to tighten the 12 flange nuts one at a time about one half turn until the rear support is removed from the HPC rear case. Remove puller.

(b) Install PWA 102301 Puller onto the HPC rear support. Pull the four detail clamps under the puller lip of the rear support. Tighten the 12 detail cap screws to lock the clamps and rocker plates in position against the puller lip. After the clamps are correctly positioned under the puller lip, tighten the 12 flange nuts one at a time about one half turn until the rear support is disassembled from the rear case. Remove the puller.

Subtask 72−35−00−030−070:

(5) Remove 64 bolts on lower flange of inside diameter of (outer) rear case. These bolts secure rear case and inner rear case to the 9th and 10th stator set.

(6) In an alternating pattern, lightly tap on upper flange of inner case at four locations (approximately 90 degrees apart) until the inner case/stator assembly releases from the outer case. See Figure 502.

(7) Attach PWA 88643 Sling or PWA 88673 Sling to HPC rear case. Remove the (outer) rear case.

HIGH PRESSURE COMPRESSOR (HPC) − DISASSEMBLY−04

Subtask 72−35−00−030−071:

(8) Use the two PWA 101980 Lifting Brackets and the PWA 102033 Puller, Mechanical to remove the HPC inner rear case from the stators. PWA 86098 Pullers can be used as optional tools for case removal when the case does not bind as follows:

  (a) Install two PWA 101980 Lifting Brackets on rear flange of the inner rear case 180 degrees apart. Attach PWA 88643 Sling or PWA 88673 Sling to lift the inner rear case.

  (b) Attach three PWA 86098 Pushers equally spaced around the rear flange of the inner rear case with five cap screws.

  (c) Install pusher with groove fitting into stepped groove in the stator assembly.

  (d) Turn single cap screw alternatively between the three pushers to remove the inner case.

  (e) Remove the two PWA 101980 Lifting Brackets.

(9) Remove Stages 13 and 14 with seals from HPC.

(10) Remove Stages 11 and 12 with seals from HPC. See Figure 503.

(11) Remove 40 bolts securing Stages 9 and 10 to Stage 8. Remove 10 bolts and nuts securing Stages 9 and 10 set together. Remove Stages 9 and 10. See Figure 504.

(12) Remove eight bolts and nuts securing Stage 8 set together. Remove Stage 8.

HIGH PRESSURE COMPRESSOR (HPC) - DISASSEMBLY-05

Task 72-35-00-030-022:

1. Disassemble The Compressor Stator (Vane) Assemblies

A. Prerequisites

(1) Disassemble The High Pressure Compressor (HPC). Refer to 72-35-00, Disassembly-03, CONFIG-2 (Task 72-35-00-030-006).

B. Equipment And Materials Necessary

Special Tools:

PWA 105507	Adapter, Install/Remove, 8th Stage Stator (Vane) Assembly
PWA 105508	Adapter, Install/Remove, 10th Stage Stator (Vane) Assembly
PWA 105509	Adapter, Install/Remove, 11th Stage Stator (Vane) Assembly
PWA 105510	Adapter, Install/Remove, 12th Stage Stator (Vane) Assembly
PWA 105511	Adapter, Install/Remove, 13th Stage Stator (Vane) Assembly
PWA 105512	Adapter, Install/Remove, 14th Stage Stator (Vane) Assembly

C. Procedure

(1) Remove the thermal insulation blanket from the stator segment (vane) feet.

(2) In the steps that follow, use the applicable stator (vane) segment set Adapter to disassemble the vane segment assemblies required for each stage.

(3) Put the correct Install/Remove Adapter on a suitable workbench and prepare the Adapter as follows: See Table 501 and Figure 501.

Stage	Vane Segment Adapter
8	PWA 105507
10	PWA 105508
11	PWA 105509
12	PWA 105510
13	PWA 105511
14	PWA 105512

Vane Segment Assembly Adapters
Table 501

(a) Move the moveable arm to the left side of the Adapter.

(b) Assemble the removal arm detail to the moveable arm of the Adapter.

(c) Install the removal stop to the Adapter base.

(4) Obtain the stator (vane) assembly to be disassembled.

(a) Locate the anti−rotation lug detail of the shroud segment on the front side of the stator (vane) assembly.

(b) Place the stator assembly on the Adapter base with the removal stop between the vane segments and the TAB arrow on the removable stop pointing to the anti−rotation lug detail of the shroud segment.

CAUTION: IF EXCESSIVE RESISTANCE IS MET DURING REMOVAL, MAKE SURE THAT THE REMOVAL STOP POSITION IS BETWEEN THE VANE SEGMENTS.

(c) In a counterclockwise direction, use the removal arm to press the shroud segment, shroud spring, and the right stator segment from the stator assembly.

NOTE: Leave the arm detail of the Adapter on the right side of the Adapter.

(d) Remove the stator segments from the Adapter base.

(e) Place the stator assembly with the shroud segment on the Adapter base with the stator segment against the inner and outer stop details of the Adapter.

(f) In a clockwise direction, use the removal arm to press the shroud segment and shroud spring from the remaining stator segment.

(g) Remove the vane segment, air seal, and spring from the Adapter.

(5) Do the above procedure again for each compressor stator (vane) assembly to be disassembled.

Task 72−35−00−030−020:

1. Remove The Flange J Brackets And Hardware

A. Equipment And Materials Necessary − None

B. Procedure

(1) Remove the Flange J brackets as follows. See Figure 501.

(a) Tag and identify the flange J hardware for the correct bolthole locations.

NOTE: All the part item numbers in the figures are the same as the item numbers in the IPC.

(b) Remove the bolts and nuts that attach the brackets to Flange J. Remove the brackets from the flange.

HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-01

Task 72-35-00-990-004:

1. General Inspection Requirements - High Pressure Compressor (HPC)

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/ subassemblies are provided in individual Inspection/ Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check-00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−01

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/ subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−01

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−35−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−35−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

   (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

   (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−03

Task 72−35−00−990−005:

1. Visual Inspection − High Pressure Compressor (HPC)
   A. For inspection requirements applicable to installed (accessible) parts of High Pressure Compressor (HPC) see 72−00−35, Inspection/Check−02 (Task 72−00−35−210−001) and 72−00−35, Inspection/Check−03 (Task 72−00−35−210−002).

Previous Pageblock Return to Previous Menu Next Pageblock

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

Task 72−35−00−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, C, or D located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.
D	This fit or clearance involves a component for which it is considered necessary to replace the used part with a new part at the time of overhaul in order to restore a wear or sealing surface. It is not required to dimensionally examine this fit if all of the conditions that follow are met: − The used wear, or sealing component has been replaced with a new part. − The mating part(s) have been visually and dimensionally examined as necessary by the applicable PW4000 series CIR, PN 51A375 section(s) for the part(s), and meet the permitted wear, and dimensional requirements on the surface(s) involved in the fit or clearance.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

(CONTINUED)

less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances
The following General NOTES are applicable to two or more fits and Clearances reference numbers. The applicable reference numbers are included in the NOTES.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

NOTE: General NOTE 1: For Reference Numbers 1278 through 1291, you can measure the knife−edge diameter of the fit and not measure the HPC shroud segments (honeycomb) air seal diameters if all of the following conditions are met in the PW4000 Series CIR, PN 51A357.

The measured knife−edge diameter is within the CIR manual Inspection/Check−04 serviceable limits.

Honeycomb trenching (if present) is within the CIR manual Inspection/Check−03 and Inspection/Check−04 serviceable limits.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

Task 72−35−00−990−010:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, C, or D located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.
D	This fit or clearance involves a component for which it is considered necessary to replace the used part with a new part at the time of overhaul in order to restore a wear or sealing surface. It is not required to dimensionally examine this fit if all of the conditions that follow are met: − The used wear, or sealing component has been replaced with a new part. − The mating part(s) have been visually and dimensionally examined as necessary by the applicable PW4000 series CIR, PN 51A375 section(s) for the part(s), and meet the permitted wear, and dimensional requirements on the surface(s) involved in the fit or clearance.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

```
0.517          (−)        0.512      =          .005
(13.131)                  (13.005)              (0.126)

0.527          (−)        0.508      =          .019
(13.385)                  (12.903)              (0.482)
```

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max

(CONTINUED)

less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances
The following General NOTES are applicable to two or more fits and Clearances reference numbers. The applicable reference numbers are included in the NOTES.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

NOTE: General NOTE 1: For Reference Nos. 1278 through 1291, you can measure the knife−edge diameter of the fit and not measure the HPC shroud segments (honeycomb) airseal diameters if all of the following conditions are met in the PW4000 Series CIR, PN 51A357.

The measured knife−edge diameter is within the CIR manual Inspection/Check−04 serviceable limits.

Honeycomb trenching (if present) is within the CIR manual Inspection/Check−03 and Inspection/Check−04 serviceable limits.

The 8th through 14th stage inner case diameter components of the fit Reference Nos. 6379, 6380, 6400 through 6410, 6414, 6415 and 6417 are within the CIR manual Inspection/Check−04 serviceable limits.

All vane to the inner case, vane to outer airseal, and vane to the inner airseal contact surface wear (if present) is within the CIR Manual Inspection/Check−03 and Inspection/Check−04 serviceable limits.

You must install new HPC shroud (damper) springs.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

Task 72−35−00−990−006:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, C, or D located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.
D	This fit or clearance involves a component for which it is considered necessary to replace the used part with a new part at the time of overhaul in order to restore a wear or sealing surface. It is not required to dimensionally examine this fit if all of the conditions that follow are met: − The used wear, or sealing component has been replaced with a new part. − The mating part(s) have been visually and dimensionally examined as necessary by the applicable PW4000 series CIR, PN 51A375 section(s) for the part(s), and meet the permitted wear, and dimensional requirements on the surface(s) involved in the fit or clearance.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

(1) Limits applicable to any combination of new or used parts.

- (a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.
- (b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.
- (c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

(CONTINUED)

less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances
The following General NOTES are applicable to two or more fits and Clearances reference numbers. The applicable reference numbers are included in the NOTES.

HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-04

NOTE: General NOTE 1: For Reference Numbers 1278 through 1291, you can measure the knife-edge diameter of the fit and not measure the HPC shroud segments (honeycomb) air seal diameters if all of the following conditions are met in the PW4000 Series CIR, PN 51A357.

> The measured knife-edge diameter is within the CIR manual Inspection/Check-04 serviceable limits.
>
> Honeycomb trenching (if present) is within the CIR manual Inspection/Check-03 and Inspection/Check-04 serviceable limits.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

Task 72−35−00−990−011:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B, C, or D located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.
D	This fit or clearance involves a component for which it is considered necessary to replace the used part with a new part at the time of overhaul in order to restore a wear or sealing surface. It is not required to dimensionally examine this fit if all of the conditions that follow are met: − The used wear, or sealing component has been replaced with a new part. − The mating part(s) have been visually and dimensionally examined as necessary by the applicable PW4000 series CIR, PN 51A375 section(s) for the part(s), and meet the permitted wear, and dimensional requirements on the surface(s) involved in the fit or clearance.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
(CONTINUED)						

less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances
The following General NOTES are applicable to two or more fits and Clearances reference numbers. The applicable reference numbers are included in the NOTES.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

NOTE: General NOTE 1: For Reference Nos. 1278 through 1291, you can measure the knife−edge diameter of the fit and not measure the HPC shroud segments (honeycomb) airseal diameters if all of the following conditions are met in the PW4000 Series CIR, PN 51A357.

The measured knife−edge diameter is within the CIR manual Inspection/Check−04 serviceable limits.

Honeycomb trenching (if present) is within the CIR manual Inspection/Check−03 and Inspection/Check−04 serviceable limits.

The 8th through 14th stage inner case diameter components of the fit Reference Nos. 6379, 6380, 6400 through 6410, 6414, 6415 and 6417 are within the CIR manual Inspection/Check−04 serviceable limits.

All vane to the inner case, vane to outer airseal, and vane to the inner airseal contact surface wear (if present) is within the CIR Manual Inspection/Check−03 and Inspection/Check−04 serviceable limits.

You must install new HPC shroud (damper) springs.

Ref.	F		Dimensions		Limits	
No.	R	Description	Min	Max	Min	Max
1354 (1)	D	Vane Inner Trunnion Sleeve Bearing (72-35-45) (Pre SB PW4ENG 72-776) HPC Inlet Shroud (Rear) Segment Assembly (72-35-41) (PN 51H470-01, Change Letter D and subsequent) (See Figure 801, Sheet 3, And Figure 802, Sheet 3)				
		Bearing	.480 (12.192)	.484 (12.293)		
		Segment	.490 (12.446)	.496 (12.598)	.006 (0.15)	.016 (0.41)
1354 (2)	D	Vane Inner Trunnion Sleeve Bearing (72-35-45) (Post SB PW4ENG 72-776) HPC Inlet Shroud (Rear) Segment Assembly (72-35-41) (PN 51H470-01, Change Letter D And Subsequent) (See Figure 801, Sheet 3, And Figure 802, Sheet 3)				
		Bearing	.482 (12.243)	.486 (12.344)		
		Segment	.490 (12.446)	.496 (12.598)	.004 (0.102)	.014 (0.356)
1355 (1)	D	Vane Inner Trunnion Sleeve Bearing (72-35-45) (Pre SB PW4ENG 72-776) Stage 5 HPC Shroud (Rear) Segment Assembly (72-35-42) (PN 51H385-01, Change Letter F and subsequent) (See Figure 801, Sheet 3, And Figure 802, Sheet 3)				
		Bearing	.480 (12.192)	.484 (12.293)		
		Segment	.491 (12.472)	.496 (12.598)	.007 (0.178)	.016 (0.406)
1355 (2)	D	Vane Inner Trunnion Sleeve Bearing (72-35-45) (Post SB PW4ENG 72-776) Stage 5 HPC Shroud (Rear) Segment Assembly (72-35-42) (PN 51H385-01, Change Letter F and subsequent) (See Figure 801, Sheet 3, And Figure 802, Sheet 3)				
		Bearing	.482 (12.243)	.486 (12.344)		
		Segment	.491 (12.472)	.496 (12.598)	.005 (0.127)	.014 (0.356)
